Subject: QRM During MIR pass 4/21/96

John,
Did you really think that these QRM'ers were No code Techs from the
11 meter band ?
It would seem that these operators are seasoned DX'ers
who know how to get thru in a pile up!
Great operating skills they have learned on the hf bands running ssb..
Not quite the same game on FM !
;-)

>personally dissapointing.

You're being more than uncharitable. The choice to go to digital
satellites was driven by a desire to allow low power stations
with simple antennas to fully participate in global satellite
communications, and to take advantage of the launch opportunities
for very small satellites. PSK encoding allows smaller signal
margins than analog encodings, so low power and simple antennas
become practical for the ground stations. And, because of the
very small size and limited power budget of the microsats, use
of digital also allows the satellite to more effectively use
its limited resources to serve the broadest possible range
of amateurs.

Saying that the satellite builders aren't comfortable with
analog transponder techniques flies in the face of Oscar 10
and Oscar 13, built by pretty much the same small group of
people who have brought us the microsats. They certainly
know how to build analog transponders, but chose not to
for the microsats for sound technical (and economic) reasons.

Gary

The only trouble with this comparison is that you don't need a power
supply with the 736 (I assume that is what the FP700 is). It is built
in the 736.

Well, you should be quick because in a few months the satellite
will be the problem...

I have worked OSCAR 10 and 13 using a 2x15el crossed yagi on 70cm
and 2x6el crossed yagi for 2m. I used about 30 W max on 70cm.
The signal was not strong, but similar to the beacon.
(that is the correct level, many stations use too much power and
are stronger than the beacon)

>Any suggestions on 2 mtr pre-amp. I realise that the antenna
>system is very comprimised. Jag AA2LJ

I used a homemade preamp with a 3SK97, after a commercial preamp
turned out to be unusable because of too little preselection and
strong local VHF signals causing intermodulation.

It should be possible to make some contacts using your setup. Start
out by listening, and optimize the receive side.
The problem over here often was local QRM. No preamp will correct
that situation. When you are in a quiet environment, it should be
much easier.
Then try to locate your own signal using CW, and make sure it is not
stronger than the beacon.

Rob

Pretty sad, isn't it, Kerwin.

I looked up the three callsigns you posted about, expecting to find
inexperienced refugees from 11 meters engaging in such behavior.
Well, that stereotype didn't hold much water.... All were old enough
to have learned better by now. Two even had higher grade licenses.

The newcomer would be Shannon herself. Let's hope she can see past
the few thoughtless ones to the real hams out here.

From: RNROBERT@UConnVM.UConn.Edu (Rob Robertson)
Subject: Questions from a Novice

Please fill me in...

I am a novice to the amateur radio hobby. I have recently started monitoring
local radio, including emergency services, HAM, and air traffic with a
basic commercial scanner.(It's a PRO-23 handheld unit, very simple.)

I am particularly fascinated by air traffic radio transmissions, and would
like to further my knowledge, and perhaps begin monitoring satellite and
manned spacecraft transmissions. I have noticed that many of the postings to
this group involve antennas and specific satellites. I also read the recent
posting on space shuttle radio frequencies. I notice that many of the freqs
are in ranges that my hand-held scanner is capable of receiving... If I find
the proper frequencies, can I pull down space shuttle radio transmissions with
my scanner? Do I need a special antenna?

I noticed there are amateur rebroadcasts of shuttle radio transmissions. Are
other spacecraft or satellites routinely rebroadcast in a manner such that I
can receive them with my simple monitor?

What would be involved, in terms of equipment and expense, for a hobbyist to
begin monitoring spaceborne radio transmissions?

Thank you for any replies,

Rob

>repeaters etc ... and it works ok. What is the normal amount of power
>required.

You don't say which satellite you're trying to use. For Oscar 10 and 13,
35 watts and gain yagis should be sufficient to put your downlink signal
equal to the beacon. Does the beacon sound strong to you? If it doesn't,
you may have one of several problems. If you aren't using a mast mount
preamp, you should be. Or there may be a problem with your Rx antenna.
Or you could be off-pointed from the satellite, or using the wrong
polarization sense. If the beacon does sound strong to you, then the
problem is likely high loss cables to your uplink antenna, or a problem
with the uplink antenna itself, or you may be using the wrong polarization
sense. Or it may be that your Tx antenna isn't boresighted with your
Rx antenna.

If you're trying to use one of the LEOs, then 35 watts is *more*
than enough uplink power (5 watts should be sufficient). Again,
troubleshoot as noted above. Make sure you're receiving the beacon
strongly first (typically S9 or so). This will tell you that your
receiving system is Ok. If your downlink signal is still weak
compared to the beacon, then look for loss terms in the Tx feedline
and antenna.

Check out the Project Spacetrack docs at Tom Kelso's web site. It is
a Tex document, but you can find the FORTRAN listings with a standard
text editor. I used this as the starting point for the SGP/SGP4 models
in WinOrbit. SDP4 and SDP8 are also listed.

Message-ID: <DqxG5x.G7p@cix.compulink.co.uk>
Source record: 22322

I have a 736 and when I bought it, the radios under consideration were:-

Ft736, Icom 820H, Icom 275h+Icom475h and a pair of Kenwood mono band multi modes. The problem I had in deciding was that I was interested in Satellite work, and, imo, the 736 is better equipped, more control-able but the Icoms had better RX. 736+mast head pre amp works very well, and, of course, the radio will do 2/70+6m+23cms with the additional modules.

The only other option under consideration was an HF+6m or HF only radio with a transverter, Ft1000mp+transverter or TS950/850/870+transverter. Again, the Yaesu is better as I believe you can programme the display on the ft1000 to show the true TX/RX frequency on the display, without having to do the mental arithmetic.

Just my 2 pennies worth.

Subject: Mir operating suggestions and thoughts..

Hello to all .
I am Dave N1PPP and have operated Mir under many circustances and in many ways.. there is one clear rule the loudest
signal makes it.. however the person on the Mir station doesn't necessarilly want to talk to the loudest signal. He or she as it is
now has their own set of ideas needs, wants and desires.
I have found most of the crews on Mir get lonely after they have been up there for a month or two, but there are exceptions.
The soviet operating crews tend to be there to do business and only operate the station when and if they really have spare time
and have nothing else constructive to do, the americans, on the other hand try to use the radio to get in touch with friends and
relatives, and to stay in touch with American culture, activities, and interests.
The argumentative comments I have seen in this newsgroup amount to no more than childish tantrums.
Operators can be calling Mir from literally all over the Uninted States and Canada some are in phase and can hear, others are
out of phase and really don't know what is going on, or can't hear who is talking or what they are saying, there is always going
to be competition if an exotic station operates on a single frequency, and Mir is no exception. There are a few stations operating
kansas city trackers with 22 element beams and 600 watt amps and they are going to be heard or at least destroy any
possiblility of a 50 watt station making it through. If two of these powerful stations are competing there is little chance of any of
the smaller stations being heard, and for the good news.. most of the Mir crews like to talk to the little guys so if the big guys
don't get mad and jam the smaller stations (which happens) the Mir operator often calls the weaker signals. I taked to Norm
Thaggard regarding a school contact while at the drive up at a local McDonalds on a 5 watt HT and got my message through
before a local bad operator thought I was talking to Norm (another Ham locally) on the Mir freq and jammed me off. Norm
Thaggard remembered his callsign and never answered his calls.
The only suggestion I can constructively make is to be on your best behavior when you operate Mir behave as you would have
someone else behave. remember if you jam someone else you will get jammed too.
This radio is an important source of enjoyment and entertainment for the Mir crew so do your best to make it enjoyable for them
have something nice ready to tell them, a short joke a quick piece of sports news try to please them and you will be rewarded, I
have been called by Mir by many crews and personally thanked for being there to offer them a little enjoyment in what otherwise
is a rather spartan existance, and you can to.
Get the best antenna setup you can arrange, I built an azimuth elevation rotor from two old tv rotors and use a 13b2 vertically

polarized and generally have been able to make sucessfull contacts with 25 watts. at other times it is impossible to get through
with 150 watts. The conditions vary considerably and the number of people trying varies drastically and when there are a 1000
people putting out 50 watts of qrm each Mir hears nothing except junk, undecipherable and annoying and they shut the radio
off. If you are interested in Mir information and some interesting documents concerning Mir visit my web page at
http://www.cyberportal.net/dhend/dave1.html
I haven't been able to udate it recently but there are some very good up to date links and some messages from U8MIR and a
dissertation by Miles WF1F about conduct on the Mir frequency which is if nothing else informative.
Most Important
if you are not having fun. shut the dam thing off and look for something you can do to have fun..
73 DAVE

Hello, OM,
By now you've probably gotten several messages saying that rs-12 is
alive and doing fine. The 10 meter downlink is still loud and clear at
my house. They have turned on the 2 meter downlink also, and I believe
that you could probably get better reception on that band (haven't
tried it yet. I can't comment on STS software.
Hope to work you on rs-12 soon.

There are also people who are makeing a contact at EVERY pass. I always see the same people connecting to the PBBS. I have yet to get into it. I have connected to the keyboard, but alas at night when they are asleep.
There are 2 calls that I always see in there at every pass. They know who they are. How about giving others a chance? Do you really need to be there at every pass?

What's the status of the packet station onboard? She's been very quiet for a while now.

You *may* be able to receive Shuttle and MIR transmissions with just
the handheld. I've heard both with an amateur handheld. The only reservations
would be whether your scanner has the sensitivity of my HT, and whether
you're listening to a favorable pass. A special antenna is very helpful,
especially when the pass is near your horizon. If you don't care if you
understand what you hear, you can also hear the pacsats pass overhead.
(If you buy packet equipment, you can decode and read these messages.)

>I noticed there are amateur rebroadcasts of shuttle radio transmissions. Are
>other spacecraft or satellites routinely rebroadcast in a manner such that I
>can receive them with my simple monitor?

I've heard of gateway stations which allow HT equipped amateurs to
work the Oscar analog satellites. I don't know if there are any in
your area. There are also digital gateway stations for relaying amateur
packet transmissions via satellite. I don't expect you'd find listening
to one of those very interesting, however, unless you invest in packet
equipment to decode the signals.

>What would be involved, in terms of equipment and expense, for a hobbyist to
>begin monitoring spaceborne radio transmissions?

What you have is a start. Try for MIR and Shuttle (next time it is up
with a SAREX payload). You need an orbit tracking program so you'll
know when to listen. An outside antenna may help, a steerable beam
antenna certainly would. Some of the easiest satellites to receive
are the pacsats. You'd need packet equipment to decode their messages
(sort of like reading a BBS). And there are the polar orbiting Wx

satellites. With the proper decoding software, you can receive pix
of the global cloud cover direct from these satellites and do your
own weather forcasts, lots of fun.

>ways.. there is one clear rule the loudest
>signal makes it.. however the person on the Mir station doesn't necessarilly
>want to talk to the loudest signal. He or she as it is
>now has their own set of ideas needs, wants and desires.

Quite true - unlike the OSCAR satellites having a person at the other end of the mike makes a difference. If the person aboard a spacecraft doesn't like some form of oboxious behavior - don't expect them to answer.

>the americans, on the other hand try
>to use the radio to get in touch with friends and
>relatives, and to stay in touch with American culture, activities, and interests.

This is a pretty general statement to make considering that there have been only two long term Amercians aboard Mir - Norm Thagard and Shannon Lucid. But overall, I'd say that it's a good general statement.

It's important to note that while neither of them has a valid U.S. ham license, they both have had exposure to amateur radio.

Norm Thagard was a ham while growing up in Jacksonville Florida, and enthusiastic operating on shortwave bands. So he knows from personal experience what it's like to try to get that 'special station' and the frustration of not being able to get through due to the 'heavy guns' constantly using more power or fancier equipment. His ham license lapsed when he went to Vietnam as a Marine fighter pilot and he never renewed his license.

Shannon Lucid got to use the SAREX equipment aboard her previous shuttle flight, STS-58. She used it for a family personal contact, and I think she did a school contact. So she's aware of how many hams on the ground are interested in talking to a spacecraft in orbit, but doesn't have the ham background Norm did of trying to get through to a rare station.

Both have used the radio on a regular basis to talk to their fellow ham astronauts as often as possible when flying over Houston. As much as anything else it's catching up on office gossip.

>The argumentative comments I have seen in this newsgroup amount to no more than

>childish tantrums.

But also legitimate concerns. I am rather concerned about the case where people were - almost certainly - intentionally trying to 'force' their way in to a Mir conversation even though it was clear that the person aboard Mir was already talking to somebody else.

>There are a few stations operating
>kansas city trackers with 22 element beams and 600 watt amps and they
are
>going to be heard or at least destroy any
>possiblility of a 50 watt station making it through. If two of these
powerful
>stations are competing there is little chance of any of
>the smaller stations being heard

Quite true - Dick Richards KB5SIW once commented to me "He who has the power rules the airwaves".

>and for the good news.. most of the Mir crews
>like to talk to the little guys so if the big guys
>don't get mad and jam the smaller stations (which happens) the Mir
operator
>often calls the weaker signals. I taked to Norm
>Thaggard regarding a school contact while at the drive up at a local
McDonalds
>on a 5 watt HT and got my message through
>before a local bad operator thought I was talking to Norm (another Ham
locally
>) on the Mir freq and jammed me off. Norm
>Thaggard remembered his callsign and never answered his calls.

kudos to Norm! When I interviewed him after the mission he told me that there were these big guns who he had talked to 'any number of times' who kept trying. And he would ignore them because he wanted to give others a chance.

5 watts isn't an unreasonable amount of power to use when contacting Mir. I talked to Sergei Adeev of the Mir 20 crew using a 5 watt handheld in to a J-pole antenna - succeeding primarily because it was 3 am local, and I didn't have much competition!

>This radio is an important source of enjoyment and entertainment for the
Mir
>crew so do your best to make it enjoyable for them

Which is something always to remember - for both the ground and the person in space. For the space travellers (notice how I carefully avoid using astronaut/cosmonaut?) the radio on Mir is a source of recreation, and for the Americans also a link home. For the hams on the ground it's a feather to put in your cap - an unusual contact. But the folks aboard Mir are more likely to want to chat with somebody and just talk - shooting the breeze since they're up there for a long time.

>Get the best antenna setup you can arrange, I built an azimuth elevation
rotor
>from two old tv rotors and use a 13b2 vertically
>polarized and generally have been able to make sucessfull contacts with
25
>watts. at other times it is impossible to get through
>with 150 watts. The conditions vary considerably and the number of
people
>trying varies drastically and when there are a 1000
>people putting out 50 watts of qrm each Mir hears nothing except junk,
>undecipherable and annoying and they shut the radio off.

Quite true. I use a 45 watt mobile in to a J-pole antenna now, but plan
to upgrade to a directional set up in the near future. But the current
setup has enough power -- as long as folks cooperate and don't try to
step over each other!

>Most Important if you are not having fun. shut the dam thing off and
look for something you
>can do to have fun..

Agreed. Which also applies just as much on the ground as in space.
You've made some excellent comments Dave.

912. Radio Station Database Program Stand Alone

Newsgroup: rec.radio.amateur.space
Date: 1996-05-06 00:00:00 UTC
From: Charles Bolland <chuck@flinet.com>
Message-ID: <318E27BD.1D66@flinet.com>
Source record: 22329
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc.,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.noncomm,rec.radio.scanner,rec.radio.swap

Sir,

It's still available. The IBM/DOS Broadcasting Radio Station Database Program for Longwave, Mediumwave, and Shortwave. Over 4,000 records included already. The program is completely read and write. Records can be added or changed. Sorts in many different formats both on your screen and printing.

If you would like a copy of the program, send your request to "chuck@flinet.com". Please include your MAILING ADDRESS - SNAIL MAIL. For example, your street number, city, state and zipcode. Also include your EMAIL address.

The program will be sent to you via EMail probably within 24 hour is not sooner. If you reqeust the program and havenn't received it in that period, check back with me. Sometimes things get lost on the internet.

Remember to send your address. Requests without a mailing address will not be acknowledge to save time on the internet. In the past requests without an address were reminded with a message. Usually, the reminder went unanswered anyway. If it wasn't, the reply was sometimes very rude.

This program is FREE! Everything works. It has many features and they all work, not like shareware where some of the features work and other don't.

Your Postal address and EMail address will be kept CONFIDENTIAL. I may in the future contact you via Snail mail with a description about the Voyageur Database program. That's it.

Hope to hear from you and best regards.

Dave,
Bottom line is that we all should use proper operating procedure
that have been outlined before for Mir contacts on both voice and packet !
DO NOT CALL MIR UNTIL YOU SEE OR HEAR A CQ from MIR
How much easier could this be..
I believe that too many hf contesters went out and bought a ringo ranger
and a brick connected to their standard ht's are all trying to make the
big contact

Good luck with your next contacts

914. How do I get Noaa images using SoundBlaster V2 card.

Newsgroup: rec.radio.amateur.space
Date: 1996-05-06 00:00:00 UTC
From: djb@digweed.win-uk.net
Message-ID: <37@digweed.win-uk.net>
Source record: 22331

I have just read some info. printed by DALLAS REMOTE IMADING GROUP,
received from a local BB. along with a programme called SBDSP.

Has any one managed to Demodulate a recording of the received NOAA
satellite signals, in to an image file using a SoundBlaster2 card. ?

The programme SBDSP Demodulates a .VOC file in to a .IMG file so
that it can be viewed.

I seem to have a problem running the SBDSP
programme. I can't make a .VOC file without an
header which upsets the SBDSP programme.

My alternative method is to build the AM. A to D. decoder
interface, refered to by JVFAX software. Then use JVFAX to view.

I have spent the last 18 months building a suitable receiver for
weather satellite reception with a frequency deviation of +/- 20KHz.
This is now up and running with good results. I am at the stage were
I need to decode the audible output.

Can any body help.

THANKS inadvance

Derek

Lewis,

I use the FT290RII for my satellite and SAREX work. I also run a
150w amp that helps. The nice thing about the radio is that is also
has an RIT control that is often not found on the FM only radios. It
has come in handy for the SAREX contacts. If you only have so much money
to spend and you want portability along with all-mode, then this is the
radio to get. Good luck.

Hello Lewis,
First of, I am not familiar with this radio. But just knowing that
it is a 2 meter all-mode says to me that it could be used for satellite
a
work. I'm making contacts thru rs-10 and rs-12. RS-10 has a two meter
up-link. I'm using a j-pole and a 20 watt 2 meter source (transmit
converter and amplifier). I have made contacts running only 2 watts.
RS-10 has a 10 meter down-link, so you will need another rig to
recieve on 10 meters. RS-12 has a 15 meter up-link and a 10 meter and 2
meter down-link. I think that the 2 meter down-link would be easier to
hear, but I've not listened to it (only the 10 meter down-link).
A 2 meter all-mode rig would be perfect for either the up-link or
the down-link on 4 satellites that I know of (the Japanese satellite has
a 2 meter up-link and a 70 centimeter down-link (you can get a kit from
Hamtronics to convert 70 centimeters to 10 meters for 60 or 70 dollars I
think.
Good luck and maybe I'll catch you
on the bird soon. 73's--Bill N5XYN

In article <37@digweed.win-uk.net>, djb@digweed.win-uk.net (Derek Bayley) says:
>
>I have just read some info. printed by DALLAS REMOTE IMADING GROUP,
>received from a local BB. along with a programme called SBDSP.
>
>Has any one managed to Demodulate a recording of the received NOAA
>satellite signals, in to an image file using a SoundBlaster2 card. ?
>
>The programme SBDSP Demodulates a .VOC file in to a .IMG file so
>that it can be viewed.
>
>I seem to have a problem running the SBDSP
>programme. I can't make a .VOC file without an
>header which upsets the SBDSP programme.
>
>My alternative method is to build the AM. A to D. decoder
>interface, refered to by JVFAX software. Then use JVFAX to view.
>
>I have spent the last 18 months building a suitable receiver for
>weather satellite reception with a frequency deviation of +/- 20KHz.
>This is now up and running with good results. I am at the stage were
>I need to decode the audible output.
>
>Can any body help.
>
>THANKS inadvance
>
>Derek
>
>
>
While I have yet to view an image captured with SBDSP, if you "record"
the pass as a voc, then use the voc to wav converter that comes from
creative labs with the SB, SBDSP will process the resultant wav file with
errors. Of course then you have to veiw the file, I have tried several
different "viewers" with rather poor results.
I use JVFAX 7.0 (I like to capture passes as GIFs, easier for me to work
with than TGA(JVFAX 7.1 uses the TGA picture format). I use an A&A
NOAA WEFAX demod, feeding a modified printer board for my pc.
IF you go to the finnish funet site(sorry I do not have the url handy),
in one of the subdirectories under hamradio (like fax/sstv or something
like that), there is a program called Channelx (Copyright 1993 by
Johannes Lehtinen) that should capture, proccess, and display the NOAA
wesat image. The documentation is in Finnish, and that is on language

that I can not even begin to "decypher". When you run channelx, the screen commands are in English. I have not had a chance to try Channelx. The wx has been rather stormy here in central Kentucky, and I have disconnected my NOAA antenna. While it has lightening "protection" (kind of an oxymoron), I tend to disconnect the antenna feedline during this type of weather. IF you can not find channelx on funet, just Email me and I will attach it to a return email. I use Eudora, and a lot of people hate the methode Eudora uses to attach files. Unless you are using Eudora, my email attachment might not be too usefull to you.
Good luck and good viewing. You really want to have you NOAA receive setup working by late summer. The huuricanes are real interesting to watch.

In a previous article, chuck@flinet.com (Charles Bolland) says:

>Sir,
>
>It's still available. The IBM/DOS Broadcasting Radio Station Database
>Program for Longwave, Mediumwave, and Shortwave. Over 4,000 records
>included already. The program is completely read and write. Records
>can be added or changed. Sorts in many different formats both on your
>screen and printing.
>

Just a couple notes on the program.

It's a great program and database; I've gotten some use out of it and
it's fun!

Be warned, however, that it it is a MIME-encoded zipped file which is
almost 1 meg in size. My mailbox here only holds 1 meg and I had quite a
time getting it when it first arrived!

73, Zack W9SZ

924. Special Invitation: X Prize May 18th Gala Debut!

Newsgroup: rec.radio.amateur.space
Date: 1996-05-08 00:00:00 UTC
From: xprize@aol.com
Message-ID: <4mqho8$kn3@newsbf02.news.aol.com>
Source record: 22341

****

ON MAY 18TH, YOU ARE INVITED TO BEGIN

THE ULTIMATE HUMAN ADVENTURE ...

THE X PRIZE

"Enabling Human Ingenuity

and

Adventure in Space!"

****

On May 20th, 1927, The Spirit of St. Louis carried Charles Lindbergh from New York to Paris and into the hearts and minds of the world. On May 18th, 1996, all eyes will be on St. Louis again.

"The X Prize is an exciting program which will do
for astronautics what Charles Lindbergh did for
aviation in 1927."
- Mr. Arthur C. Clarke, Author & Scientist

"If the X Prize is half as successful as the aviation
competitions have been, it will serve as an important
milestone in opening the space frontier to commercial
passengers and space tourism."
- Mr. Daniel S. Goldin, NASA Administrator

On May 18th, the most ambitious prize in aviation and space history will be announced at the St. Louis Science Center. The X Prize. A multi-million dollar international space prize which will shape the future of commercial space travel for private citizens. Scientists, explorers, astronauts, and business leaders from around the world will convene in St. Louis -- by invitation -- to take part in this historic announcement. Please join us.

THE X PRIZE DINNER COMMITTEE

[Co-Chairmen] Dr. Buzz Aldrin
Apollo 11 Astronaut
Chairman, National Space
Society

Mr. Erik Lindbergh
Grandson of Charles Lindbergh
Pilot

[Astronauts Attending May 18th Event]

Dr. Buzz Aldrin, Gemini 12, Apollo 11
Captain Daniel C. Brandenstein
Colonel Gerald P. Carr, Skylab 4
Mr. Robert J. Cenker
Dr. Mary L. Cleave
Colonel Richard O. Covey, STS 51-I, STS 26, STS 38, STS 61
Mr. R. Walter Cunningham, Apollo 7
Dr. Samuel T. Durrance, STS 35
Dr. Owen K. Garriott, Skylab 3, STS 9
Dr. Linda M. Godwin
Mr. Richard J. Hieb
Dr. Byron Lichtenberg, STS 9, STS 45
Captain Jon A. McBride, STS 41-G
Col. Steven R. Nagel
Colonel William R. Pogue, Skylab 4
Dr. Harrison H. Schmitt, Apollo 17
General Thomas P. Stafford, Gemini 6, Gemini 9, Apollo 10
Dr. Charles Walker, STS 41-D, STS 51-D, STS 61-B
Dr. Taylor G. Wang, STS 51-B

You are invited to join astronauts, explorers, aerospace and business leaders at a black-tie gala event on May 18th.

The X Prize is endorsed by the following Space Organizations:
* Aero Club of France
* Aerospace States Association
* Association of Space Explorers
* The Explorers Club
* Federation Aeronautique Internationale
* National Space Society
* National Aeronautics & Space Administration
* Society of Experimental Test Pilots
* Space Frontier Foundation
* U.S. Space Foundation

[EVENT DETAILS]
Location: St. Louis Science Center, St. Louis, MO.
Cocktails: 6:30 p.m.
Dinner & Event: 8:00 p.m.
Price: $500 per ticket*
$4,000 per table of eight (two members of the New Spirit of St. Louis Committee and/or astronauts will join your table for a total of ten).
Dress: Black-Tie
Valet Parking

*Approximately $400 of the $500 is tax-deductible

Please RSVP no later than May 10, 1996.
For more infomation, please call 314 - 982 - 9172.
or e-mail to Xprize@aol.com

To RSVP: Please send the following information:

Name:_____

Organization:_____

Address:_____

City:_____State: _____ Zip: _____

Tel: _____

Number of Tickets Requested: _____

I have enclosed a check for: $_____ ($500 per seat)

Please seat the following guests at my table:
(1) {include your name}
(2)
(3)
(4)
(5)
(6)
(7)
(8)

Please send check and above information to:
The X Prize Foundation, 200 N. Broadway, Suite 1800
St. Louis, MO USA 63102. Tel: 314-982-9172

X PRIZE GENERAL INFORMATION:
The X Prize has been created to educate the public about space tourism and to accelerate the development of low-cost, reusable launch vehicles and thereby jump-start the creation of a space tourism industry.

Prizes work. In the 1920's and 1930's hundreds of aviation prizes pushed the envelope of speed, distance, endurance and safety in the fledgling aeronautical industry. In 1926 and 1927 alone, more than $100 million worth or prizes (in 1996 dollars) were offered to challenge the flying community. Today, only 70 years later, aviation is a global $250 billion industry.

The X Prize follows in the long-standing tradition of aviation prizes. This is the first-ever human spaceflight prize. The multi-million cash prize will be awarded to the first group to privately build and demonstrate a spaceship which can carry at least three people to a 100 km (sub-orbital) altitude on a repeatable basis. Details of the X Prize rules will be announced on May 18th.

It is the intent of the X Prize Foundation, that those who compete for and win the X Prize will soon become modern-day heroes and transportation innovators. The X Prize will inspire today's greatest entrepreneurs.

I just got a new computer with Win95 loaded. The old 386 ran Instantrack just fine, but it is a DOS program. Will it run OK in a DOS window from within Win95? A lot of the DOS commands are missing in the crippled Win95 version and I don't want to load DOS 6.22 on top of the Win95 DOS version 7.0 (incomplete) because of possible backward incompatibility.

66.47 Viesintos Lithuania 12 05h00-22h00
66.50 Sofia Bulgaria 10 24hrs
66.56 Poznan Poland 56 04h57(Sun05h57)-02h00(Sat03h00)
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 06h00-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 o (= East),
elevation 27 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA, Bratislava
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB

Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

April 1996
Lyrids

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:

. local time = UT + 2 hours
. * the Lyrid maximum took place at about April 22, 2h UT
. ? possibly direct reception

Maurice De Meyere / Chris Steyaert

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 30 degs
Antenna amplifier: 10dB gain, smallband resonance lambda/4 antenna filter.
Frequency: (1)=66.29 Mhz (signal) and (2)=65.3 Mhz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anticoincindence measurement rejects
registration of broadbanded spurious signals (lightnings, computers,
ingition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:

results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic E.

* Lyrid maximum on Apr 22, 2-3h UT.

Paul Vauterin

Observer: Ilkka Yrjola
Location: Finland (26 35' E, 60 54' N)
Frequency: 87.360 MHz
Receiver: narrow band FM, detected signal level >-122dBm.
Antenna: 2 element Yagi with 4dBd gain to SW.
Antenna Azimuth: 45 o (SW)
Computer: T-1000SE
Data sampling system: threshold crossing detection is fed in binary
form (1 bit) from the receiver to the computer.
Computer logs total hourly elapsed reflection time, number of
threshold crossings for the hour, the longest time the signal was
continuously above detection level for the hour.

Data stored in the Compact MS-Soft format. Software for viewing available
from FTP.FUNET.FI pub/ham/vhf-work/mssoft42.zip

2. ANNOUNCEMENT

MBC, Meteor Burst Communications Europe, is a starting company which will implement a wireless network using meteor scatter. By early 1997 the network should be covering the Benelux, France, Germany, Switzerland and Denmark.
They can be contacted at: PO Box 189, NL-6500 AD Nijmegen, Netherlands, tel 024 3666703, fax 024 3666705.

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and has gradually been expanded.

Typically it contains: summaries of recent observations, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list,
please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge
from J. Van Wassenhove (current or back-issues).

930. Instant track time problem.

Newsgroup: rec.radio.amateur.space
Date: 1996-05-08 00:00:00 UTC
From: Marty Wallace <mart@ois.com.au>
Message-ID: <3190A87F.6F93@ois.com.au>
Source record: 22347

I have a problem with Instanttrack.
When I look at the coordinates for the sun or moon they appear way out.
ie. It indicates that the sun should be up even though it's night time.

I am using windows 95 on a 90 M Pentium.

The time reads right in the program and in the windows setup.
I am using the new patch for the character problem. (Fixed it up nicely)
The program worked ok on my old 386 but this is the first time I've had
it running on the Pentium.

What is the problem?

931. Coaxial and/or Counterwound Helix Antennas

Newsgroup: rec.radio.amateur.space
Date: 1996-05-08 00:00:00 UTC
From: blanton@ni.net
Message-ID: <blanton-0805962242300001@xband.ni.net>
Source record: 22348
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.space

I'm thinking about building some circularly polarized antennas for Oscar use (145 & 435 MHz). Has anyone tried installing a 435 MHz helix coaxially inside a 145 MHz helix? Or would there be too much interaction?

In a related question, has anyone tried building counterwound helices for the same frequency band on a common framework for left and right circular polarizations (but separately fed, of course)?

If anyone can point me to some references in these two areas I'd really appreciate it. Thanks.

Lee, WA8YBT/6

932. Which of the oscars/hamsats have 2 meter or 440 fm downlink?

Newsgroup: rec.radio.amateur.space
Date: 1996-05-09 00:00:00 UTC
From: n9xlt@holli.com
Message-ID: <Dr4twr.75t@iquest.net>
Source record: 22349

Which of the ham satellites have 2 meter or 440 mhz fm
downlinks? I have the necessary tracking resources, but would greatly
appriciate any satellite names, freqs, etc... that have fm downlinks.
Even URLs of sites containing this information would help. I have on
occasion listened to some of these birds from my car and other radios so
I know there are some using simple 2 meter fm.

Please respond to n9xlt@holli.com or if this information would
benifit others, post in this group.

Thanks again,
David A. Wallace
n9xlt@holli.com

Lee,

For the same amount of material / weight / wind load a cross yagi
is better.

73, Moritz DL5UH

935. NORAD Two-Line Orbital Element Sets (TLE809)

Newsgroup: rec.radio.amateur.space
Date: 1996-05-10 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4mvn9e$rd0@blackbird.afit.af.mil>
Source record: 22352

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

FIRST THING I WOULD DO IS TO CHECK YOUR TIMEZONE SETTING IN THE
COMPUTER, SET TZ=EST-4 IF YOU ARE IN THE EASTERN ZONE ECT..
IF YOUR COMPUTER HAS THE RIGHT TIME THAT IS PROBABLY WHAT IT IS...

With regard to your recommendation on using archive.afit.af.mil for obtaining orbital elements. Is this site still functioning? I used to use it all the time with great success but it seems it has been months since I have been able to get a response from that site. Are there alternatives?

see the title :)

they only sell for like 200+$, and the only other sat. cap. modem is the pk2232
and that costs about 800+

which should i get for sat work?

thanks

Further to that, I run my computer time as UTC. Being in a half-hour time zone, it helps out a great deal as there are very few programs on the market that take this into account. Too bad everything gets written for hourly time differences but, I guess you have to market to where the population is greatest.

I have sorted out the problem by using the above info but I would have
thought that the timezone setting in the win 95 setup would have taken
care of this. Apparently not.

Thanks to all that responded.

943. WEATHER PICS

Newsgroup: rec.radio.amateur.space
Date: 1996-05-13 00:00:00 UTC
From: Piers Rochford <piers@sling.demon.co.uk>
Message-ID: <89351356wnr@sling.demon.co.uk>
Source record: 22360

-- A plea for assistance:

Does anybody know of any way to recieve the moving (tv) pictures
from the weather satalites. I do not know which satalite this is
broadcast from but I do know that the CNN news network from the USA
use this display for their weather forcasts.

Is it beyond the means of the average listener/viewer or can
ex commercial equipment or home build stuff be used??????????

Thanks in advance :-)

Piers.

I'm looking for plans or drawings for building circular polarized antennas.anybody can help? are they available on the www?
thanks,
73,dan ve9so@nbnet.nb.ca

From: blanton@ni.net (J. L. Blanton)
Subject: Coaxial and/or Counterwound Helix Antennas
```

I'm thinking about building some circularly polarized antennas for Oscar use (145 & 435 MHz). Has anyone tried installing a 435 MHz helix coaxially inside a 145 MHz helix? Or would there be too much interaction?

In a related question, has anyone tried building counterwound helices for the same frequency band on a common framework for left and right circular polarizations (but separately fed, of course)?

If anyone can point me to some references in these two areas I'd really appreciate it. Thanks.

Lee, WA8YBT/6

Subject: InstanTrack and Win95

I just got a new computer with Win95 loaded. The old 386 ran Instantrack just fine, but it is a DOS program. Will it run OK in a DOS window from within Win95? A lot of the DOS commands are missing in the crippled Win95 version and I don't want to load DOS 6.22 on top of the Win95 DOS version 7.0 (incomplete) because of possible backward incompatibility.

You *may* be able to receive Shuttle and MIR transmissions with just
the handheld. I've heard both with an amateur handheld. The only reservations
would be whether your scanner has the sensitivity of my HT, and whether
you're listening to a favorable pass. A special antenna is very helpful,
especially when the pass is near your horizon. If you don't care if you
understand what you hear, you can also hear the pacsats pass overhead.
(If you buy packet equipment, you can decode and read these messages.)

>I noticed there are amateur rebroadcasts of shuttle radio transmissions. Are
>other spacecraft or satellites routinely rebroadcast in a manner such that I
>can receive them with my simple monitor?

I've heard of gateway stations which allow HT equipped amateurs to
work the Oscar analog satellites. I don't know if there are any in
your area. There are also digital gateway stations for relaying amateur
packet transmissions via satellite. I don't expect you'd find listening
to one of those very interesting, however, unless you invest in packet
equipment to decode the signals.

>What would be involved, in terms of equipment and expense, for a hobbyist to
>begin monitoring spaceborne radio transmissions?

What you have is a start. Try for MIR and Shuttle (next time it is up
with a SAREX payload). You need an orbit tracking program so you'll
know when to listen. An outside antenna may help, a steerable beam
antenna certainly would. Some of the easiest satellites to receive
are the pacsats. You'd need packet equipment to decode their messages
(sort of like reading a BBS). And there are the polar orbiting Wx
satellites. With the proper decoding software, you can receive pix
of the global cloud cover direct from these satellites and do your
own weather forcasts, lots of fun.

Radio Meteor Observation Bulletin No. 33 May 1996

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.41 Siedlce Poland 39 04h57(Sun05h57)-02h00(Sat03h00)
66.47 Viesintos Lithuania 12 05h00-22h00
66.50 Sofia Bulgaria 10 24hrs
66.56 Poznan Poland 56 04h57(Sun05h57)-02h00(Sat03h00)
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 06h00-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 o (= East), elevation 27 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA, Bratislava
The receiver was calibrated with a Marconi TF2008 signal generator. Sensitivity: 5 muV (modulation frequency 1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB

Observing method: automated setup, 150 samples/second, 8 bit resolution. [Time and details of all individual meteor reflections are stored on file in the University of Ghent format (Prometeos), and are available for further analysis. Reduction software for DOS and Windows available].

April 1996

Notes:

. local time = UT + 2 hours
. * the Lyrid maximum took place at about April 22, 2h UT
. ? possibly direct reception

Maurice De Meyere / Chris Steyaert

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 30 degs
Antenna amplifier: 10dB gain, smallband resonance lambda/4 antenna filter.
Frequency: (1)=66.29 Mhz (signal) and (2)=65.3 Mhz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anticoincindence measurement rejects
registration of broadbanded spurious signals (lightnings, computers,
ingition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic E.

2. ANNOUNCEMENT

MBC, Meteor Burst Communications Europe, is a starting company which will implement a wireless network using meteor scatter. By early 1997 the network should be covering the Benelux, France, Germany, Switzerland and Denmark.
They can be contacted at: PO Box 189, NL-6500 AD Nijmegen, Netherlands, tel 024 3666703, fax 024 3666705.

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and has gradually been expanded.

Typically it contains: summaries of recent observations, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

Subject: Radio Station Database Program Stand Alone

In a previous article, chuck@flinet.com (Charles Bolland) says:

>Sir,
>
>It's still available. The IBM/DOS Broadcasting Radio Station Database
>Program for Longwave, Mediumwave, and Shortwave. Over 4,000 records
>included already. The program is completely read and write. Records
>can be added or changed. Sorts in many different formats both on your
>screen and printing.
>

Just a couple notes on the program.

It's a great program and database; I've gotten some use out of it and
it's fun!

Be warned, however, that it it is a MIME-encoded zipped file which is
almost 1 meg in size. My mailbox here only holds 1 meg and I had quite a
time getting it when it first arrived!

73, Zack W9SZ

Hi Piers!

I guess they make up a "little film" out of diferent
pictures. They play all the photos in order and in a continous
period. So they seem to be moving...

Have you seen a flower opening? Its real slow. But you
shot a photo each half our or twenty minutes. Then stick them all
and play them with a certain speed. It looks continous. Just the
same with Sat-photos.

I jope it's clear for you...

Piers:

I think I'd have to agree with Alberto(?). I beleive you can do the
same thing. The pictures come from one of several satellites.
There are the GOES (Geosynchronous Orbiting Earth Satellite, I
believe), the TIROS (Television Infrared Observational Satellite,
again I think this is correct). Each one of these satellites
have instruments that are public property, meaning, the data is
your to collect if you have the equipment.

You would want to look more into the GOES satellites, because they
pretty much sit in one place looking at the same thing the whole
time. TIROS satellites are polar orbiters and only go over a spot a
couple of times a day. They get much higher resolution images
(2 km/pixel I believe).

If you want to make weather movies, I suggest this is what you do.
First get ahold of "The Weather Satellite Handbook," it is available
through ARRL. Next, find out what animation shareware packages
are available. I saw a couple several years ago. Find out what
format the pictures need to be in and run with it from there.

Good luck,

Markus Wilkinson

I used to think that it was terrible that life was so unfair. And then I
thought, 'What if life were fair?' Then all the terrible things that
happened to us would be because we deserved them. I take great comfort in
the general hostility and unfairness of the universe.
Markus Cole, paraphrased

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Hi all!

I'm thinking of making a sort of "diary" for the Oscar.
But I need some data from time ago. I was thinking of the "Space
News" boletin or something like it. Just to tell the history of
each Oscar. Please, in English or Spanish.

If you have anything, just send a mail.
Thank you.

I recommend LogSat and their URL is included below. Nothing else even
comes close!

http://206.103.128.4:80/logsat/

I just checked out the LogSat URL. Very impressive, but it's $50-60
and looks like it will not support homebuilt dish tracking. It is
also a windows program and windows is not stable enough for me when
running real-time applications.

I'd recommend STS Orbit Plus (SOP9445.ZIP) which you can get by
ftp to oak.oakland.edu. It is under hamradio/satellite or something
like that. It is really impressive for FREEWARE (not shareware).
It will not do dish tracking but has excellent graphics. Printing
is cluged too.

My top recommendation would be SatTrack. It runs under Linux, and
not many people have it. Source code is provided and the sucker is
free. With the source code, you can interface it to just about
anything. It will autotune radios for dopler shift and point your
dish for you. I am currently trying to interface it with a custom
board running a 12' parabolic dish at Utah State University. You
can get to the SatTrack home page at
http://www.primenet.com/~bester/sattrack.html

Another one that is not bad, is shareware, and also available at
oakland is Winorb. It runs under windows, and won't track your
dish for you.

Hi,
try Winorbit or Satlog professional, both should be available at =
ftp.amsat.org. I am not sure with latest versions. You should also try =
Wisp (designed especially for PR communication). Those programms are not =
32-bit applications but I have no problem running it in Win95.

Just a comment on sat tracking. While there are very good graphic
trackers (InstantTrack, Winorb, STS-Plus), Predict (By KD2BD, John A.
Magliacane) is very simple to use, freeware (for noncomercial users)
and easy to get (AMSAT ftp archive). When I am planning the next
week of "viewing" (NOAA wxsats), Predict allows printing a schedule
and is very accurate. I am not putting any of the graphic programs
down, it is just difficult to display a graphic pass and to capture a
NOAA image at the same time. (I have considered adding a 2nd pc, like
an old PS2 30-286, to show orbital data "real time", but another
computer? my radio desk is crowded allready<g>). Even a Pentium
can not multitask fast enough to allow displaying orbital data and
receieve images at the same time. Of course I would like to be proven
wrong, so, if anyone has found a way to accomplish this,
please feel free to post a correction)
Just my $0.02 worth.
I have been using JVFAX 7.0 with the A&A wefax demod, I am experimenting
with FTV (Brian E Cauchi biane@dream.vol.mt

Hi Brett,

I've answered this type of query in the past with a homebrew
suggestion...

I quite enjoy working through the RS series satellites and use a
homebrew preamp from the 1987 ARRL handbook that seems to work very
well. I am sure that most of the recent ARRL designs will also be
of good service, the one I built uses a MRF906/907 FET and is simple
enough to be built (easily) in an evening using 'dead-bug' construction.

Nowdays I use a Phillips device, a BF981 (simply because they are
cheaper and more readily available here in VK) using much the same
design.

You don't need fancy test gear, I tune mine up using the satellite as
a signal source... so all you need is a soldering iron and less than
a handful of parts.

WinOrbit works for me. WISP doesn't seem to be stable under my 3.11
setup, and i suspect a video driver problem. WISP seems to have a lot
of features built in, and it may be more successful under '95.

imho, both are a bit of overkill as far as answering the question,
"when is rs-12 going to appear?", but the graphics are interesting.

Does anyone know of a tracking program that works out if the satellite is
in daylight? This would be of use for visual observation of satellites. I
have InstaTrack but this only shows if the sub-satellite point is in
daylight or not.

969. INTERNET ACCESS VIA AMATUER SATELLITE POSSIBLE ?-------forgive me if this has been asked before

Newsgroup: rec.radio.amateur.space
Date: 1996-05-19 00:00:00 UTC
From: daniel.roganti@tip.nl
Message-ID: <DrnFCL.AHG@tip.nl>
Source record: 22386

I'm curious about the possibility of accessing Internet via satellite when there's alot of digital communications around on the satellites. If so, what kind of data rates are avaiable using this medium ? I'm serious considering on trying this. I've heard of a BBS using a satllite so I thought Internet may be avaiable too.

please email any info,
thanks

WinOrbit is also free, and provides schedule ("ephemeris") printing in a variety of formats for a variety of events (AOS/LOS/TCA, fixed intervals, EQX, apogee/perigee, etc.), in addition to the real-time or pseudo-real-time graphic mode. Version 3.0 is in the works, with much improved formatting capabilities (you'll be able to choose the data to include in the printout.) Feedback on the types of schedule information desired by users is solicited.

A hardware control interface (no TSRs) for WinOrbit is available for homebrewers at http://www.sat-net.com/winorbit. Source code included. This is a work-in-progress. Free. Rig control software is also available there and at amsat.

If any part of the satellite's footprint is in daylight, the satellite is in
daylight.

Had to throw in my 2 cents worth.

I use PC Track. Its dos based but works great for me.

I mostly use the printouts of AOS and LOS times, but
it is fun to watch the graphics too.

977. NORAD Two-Line Orbital Element Set: Space Shuttle (96142.25000000)

SatTrack does this (and much more).

Would anyone who captured telemetry from Webersat/OSCAR-18
between 19:28:31 and 20:29:34 please send it to me either
via AO-16, uuencode and e-mail, or anonymous upload to the
ftp site 137.190.32.131. I'm especially interested in any
gathered over Africa.

Source record: 22400

Hello Piers,

A corollary to the moving picture approach suggested by other respondents is that you should be able to download satellite weather picture in the first place - which problem you may already have solved. Should you have not, however, a look through back numbers of Wireless World of about ten years ago might help. There was an article on setting up everything from antenna to PC, all of which was simple and inexpensive.

Incidentally, the Home Office responded to the article in a rather prune-faced way by pointing out that it was illegal to download such pictures as it violated the provisions of the UK's Wireless Telegraphy Act. I don't know if the Law has moved on since then.

985. How to operate Mode K on RS-12/13

Newsgroup: rec.radio.amateur.space
Date: 1996-05-22 00:00:00 UTC
From: Anders Fongen <anders.fongen@saga.telemax.no>
Message-ID: <31A32CF6.77C8@saga.telemax.no>
Source record: 22402

Hello,

I've heard that there is only mode K (21MHz up, 28MHz down)
available on RS-12. The other modes are QRT.

I have been experimenting with mode A by using separate rigs and
antennas for down- an dup-link, so that I can listen to my own
signal and be sure that I don't make QRM for others.

How do I operate on mode K, where both links will be handled
by my HF tranceiver. Do I simply calculate the downlink frequency
and hope that this is correct? Anyone here with hints and experience?

I have the same HT (FT-530), and have worked the MIR packet robot with
this and just a discone on my roof. I haven't tried much more than
that, but I read all the time of people using HT's with the SAT's.

Under ideal conditions, I used to attempt to work Oscar 21, which was a great satellite (now dead) using my Kenwood TH78a. Any HT was capable of hearing AO-21 and DOVE, but it was difficult to work the bird with a rubber duck antenna. There was a fellow in Detroit, who would sit by his car in the evening with his HT and a handheld YAGI, any regularly work AO-21 FM voice. AO-27 is supposed to be an easy bird to work, but the frequencies of uplink and downlink are a bit off the normally programmed ones on an HT. The other factor is that AO-27 is not always up and running when you are! I do wish the Russians would reactivate Oscar 21. By the way, I have worked MIR several times with my HT.

Anders Fongen <anders.fongen@saga.telemax.no> writes:

>I've heard that there is only mode K (21MHz up, 28MHz down)
>available on RS-12. The other modes are QRT.

Hello Anders,

RS-12 is running mode KT now. Many people are using the
2 meter band downlink instead of the 10m one. I've had QSOs
with several folks recently that used the 2m link. They say it
is working very, very well. And after getting all the poor
to OK signal reports from folks listening on 10m it was nice
to get an S9+20db from an OM the other night as he was
using a 22 element yagi for receiving :-)
But to answer your original question, operating on
mode K where you cannot hear your own downlink signal is
difficult. It takes me so much knob turning and button pushing,
checking and double checking the doppler charts, etc, that I
only average 2-3 contacts per pass when there is good activity.
With poor activity like late at night I make 0-1 contact per
pass. But it's fun anyway!
One key thing is to stick to the rule of tuning the
higher of the two frequencies, which for RS-12 means the
downlink. If the other guy is moving his transmit frequency
like he would for many other modes it is simply impossible to
succeed. I also think I'd go crazy having to tune the transmit
side with a single rig in split mode as opposed to the RIT :-)
I think the CW robot could be used to check tuning
accuracy with a single rig. Another reason for me to get my
last upgrade :-) (In the US, the advanced/extra class falls in
the middle of the RS-12 uplink range and I am a lowly advanced
class amateur).
Here is a summary of the RS-12 data in case you need it:

Satellite: RS-12 NASA Catalog Number: 21089
Analog Transponders:
Uplink Downlink
Mode K: 21.210 - 21.250 Mhz 29.410 MHz - 29.450 MHz
Mode T: 21.210 - 21.250 MHz 145.910 MHz - 145.950 MHz
Mode A: 145.910 - 145.950 Mhz 29.410 MHz - 29.450 MHz

Mode KT: 21 MHz uplink into 29 and 145 MHz downlinks
Mode KA: 21 MHz and 145 MHz uplinks into a common 29 MHz downlink

Beacons: 29.408 MHz, 29.454 MHz, 145.912 MHz, 145.958 MHz

Robot Upinks: 21.130 MHz, 145.830 MHz

Kindest Regards,
Pete

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

>Do you require it to be a NASA site? Why not archive.afit.af.mil?

archive.afit.af.mil offers only a limited number of satellites. I do
know that for some of the satellites that I am particularly interested
in, the keps are not in the archive files.

You may try oig1.gsfc.nasa.gov This is a telnet site, not ftp, but you
can log in and then do an FTP connection back to yourself. (I know it's
weird...) The login is oig and the password is goddard1 Follow the
instructions after that.

Happy ftp'ing

Brent

992. Weather Sats...

Newsgroup: rec.radio.amateur.space
Date: 1996-05-23 00:00:00 UTC
From: py3crx@sp-gw.py2bjo.ampr.ORG
Message-ID: <2772@SP-gw.ampr.org>
Source record: 22409

Recently I saw some guys looking for a software that can do weather pictures animation. Well, depending on the accuracy you're looking for. I use the JVFAX7.1, a home-made 8 bit A/D interface, home-made down converter (1691MHz to 470MHz) and a modified Realistic PRO-59 Scanner. The antena is a 1.5 meter meshed TVRO Dish and with this set-up I use to receive Both GOES8 and METEOSAT5. As this software was written by a german guy, it has some special masks to METEOSAT5 and some automatic features such Digital Header decoding and can do some animation with false colors. Pretty good if you just want to see moving clouds(mainly at a 525 line TV sistem such PAL-M or NTSC).
At the same time, anybody have any information abt HRPT decoders, homebrewing...?

Thanks es regards.
Marcus - PY3CRX@SP-GW.PY2BJO.AMPR.ORG - Sao Paulo - Brasil.

993. Reference for patch antennas

Newsgroup: rec.radio.amateur.space
Date: 1996-05-24 00:00:00 UTC
From: jimf@zoinks.corp.sgi.com
Message-ID: <4o55c4$edr@murrow.corp.sgi.com>
Source record: 22410
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.space

I'm interested in the design of patch antennas to evaluate them as a low profile alternative to crossed yagis, helicals etc for OSCAR work.

I recently talked to an AMSAT rep that talked about testing the 3D birds antennas by using them for just that, contacting FO20 or AO13 I think.

I have looked in my references and can only find passing mention to patch antennas and would like to know if someone can suggest a reference that goes into dome detal such as theory of operation and design parameters.

Hi

I know this mission has no SAREX.
But i say on OH2BUA Web Cluster a dx spot
from KC5FJR at 1548 UTC 25th May anouncing
STS77 on 144.550 MHz.

What does it mean?
Was voice? Or data?
Calling Who??? Hams?
Or Shanon on board Mir?
Or what???...

I apreciate any help.
Many thanks in advance.

>I have a Yaesu FT-530 HT, and wanna know if it's possible to receive
>any signal from satellites, even communicate.
>What kind of antenna I need? Thanks

key feature is that you're using a 5 watt FM handheld which only communicates on 2 meters (I think).

So the only active satellites which are FM 2 meter-only birds are - DOVE, Mir, and the shuttle SAREX experiment.

I have operated Mir using a handheld with a J-pole antenna, pretty good signal. But it helps that I was doing it at 3 am local time so I didn't have much competition.

DOVE is extremely easy to recieve on a handheld with any antenna better than a rubber duckie, and any inexpensive packet modem.

The shuttle can be easily _received_ on a handheld. But the problem with getting through is competition - if you think your puny handheld can compete with high power linear amplifiers driving motorized beam antennas then go for it -- but I doubt you'll get through.

Of course if you're using a handheld from the middle of nowhere without any competition and lucky enough to get an astronaut who's available ....

Has anyone heard or contacted MIR and our astronaut, Shannon, on
board.? I have listened and called using the position defined by the
latest Keps and have heard nothing.

Source record: 22222

Hello ALL

Well in the hope of finding out more about satelite communications, I've posted this message to the group hoping someone can set me straight.

I intend in getting into satelite "stuff" very soon but I'm just trying to get a grasp on what I need. I intend purchasing a ft736 but this looks like it is only a small portion of the $$$ required to get the show going.

I have a KPC9612 tnc and mfj1278 at the moment. I gather I can use the KPC9612 for 9600 comms (full duplex ??) and the mfj1278 for 1200 comms with MIR ??. I was also advised that I need a 1200 baud psk modem to work additional sats..

Will the combination of kpc9612/mfj1278/psk 1200 baud tnc get me "most"places ?? If not, well what do I need ??

I also got a copy of insta-trak on the weekend, it's a BRILLIANT piece of software and I just couldn't drag myself away from the screen over the weekend (while doing a Uni assignment). I understand that it works well with a "Kansas City Tracker" card. Do they get around "2nd hand" or do I have to cough up for a new one. I'd be happy to bring in one from the US.. Also, the Kenpro rotator is supposed to be the unit to buy. The Yaesu one's have not been electrically approved for Australia.

Well that brings me onto the best part, Antennas.. So what do I do here ??. Do I homebrew them or buy them. I don't have heaps of fancy test gear to build one but I have a great workshop to physically build them. Are there good designs out there for satelite antennas ??

Dumb questions maybe but ya gotta start somewhere !!!!!

Thanks for any assistance..

Pete..vk2yx

I intend purchasing a ft736....

I'd wait until you see the new Icom 821h, replacing the 820h..

....then the 736 & 820 & kenwood 790 will all drop in price..

Hows the price compare to the yaesu?

1008. TVRO KEPLERIAN DATA info ?????

Newsgroup: rec.radio.amateur.space
Date: 1996-05-27 00:00:00 UTC
From: mdim@intranet.GR
Message-ID: <199605270928.MAA06426@helios.intranet.GR>
Source record: 22225

Dear Amateur

I would like to ask you if there is a site somewhere in www. or internet
to get keplerian data for tvro sat. for Europe like
Astra A, Astra B,C,D,E, eutelsat 2F1,2F2,Intelsat 601 etc.....
I receive kep.data from ARRL through the ham-space@ucsd.edu but I can not
locate these european tvro sats in their contents (catalog number).

I am also a subscriber to" satellite times" and "AMSAT Journal" but I have not
seen anything in these magazines about those sats.

Thank you in advance

1009. Sat ants 144 & 440; what polarization?

Newsgroup: rec.radio.amateur.space
Date: 1996-05-27 00:00:00 UTC
From: "Peter Markham"
Message-ID: <4odflm$pm5@doc.zippo.com>
Source record: 22226

I will be installing a 144mhz and a 440 mhz crossed yagi for satellite work. To start with, it will be difficult to incorporate polarization switching. What is the suggested choice, for fixed polarization, if I intend to work both digital and analog birds? Why?

TIA,
Pete/wa4hei

> 73 SV1CVY Michael

Michael. You can generate your own keps for these sats, if you know
the longitude. Set the following:
Mean Motion 1.002738 (this is the only critical value)
Eccentricity 0 (or ,001 if the program blows up with zero)
Inclination 0
Argument of Perigee 0
Mean Anomaly 0
Epoch - any convenient time, like midnight: 96150.000
RA of Node - compute RA of sat longitude at chosen epoch.

WinOrbit provides a menu choice to automate the process. Other tracking
programs may do likewise. (WinOrbit, Satellite window, Edit, Special
Menu:"Make Geosynchronous", then enter the longitude. Conversion to
Right Ascension is done for you).

73!

YL & myself heard her working folks in friendswood, TX. last sunday, May 19 abt 3 in the afternoon (edt) on the standard 145.550Mhz freq. Also have heard her getting news(Dole's resigning from Congress et al) from NASA HQ in Washington on the 143.625 downlink freq which has been used alot since an activation of a ground station in VA. and Calif.

According to this mornings' News Conference from MIR via NASASelect, she's been busy "making hot tea" for her space-walking commrades!!!

I also heard that yuri and yuri may stay one month longer aboard the spacecraft.....

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

Pete,
If you can only choose one, then hands down it's right hand
polarization. Left hand has some limited use when squint angles are
way off on AO-13, and sometimes on FO-20, but right hand is the
"dominant" mode. P3D will be right hand polarized....Go right hand.

1016. How to determine pol. of X-yagi?

Newsgroup: rec.radio.amateur.space

From: joachimp@stud.unit.no
Message-ID: <4ohs7t$hkr@due.unit.no>
Source record: 22233

Using crossed yagis (not staggered) phased with a 1/4 wavelength stub,
how do I determine which polarisation I get? I have been trying to
figure it out for myself, but I can't agree with myself. The ARRL
antenna handbook wasn't much help, I'm afraid..

1017. Our VHF/UHF frequencies at risk - again!

Newsgroup: rec.radio.amateur.space
Date: 1996-05-29 00:00:00 UTC
From: Carl Estey <carl.estey@HBC.Honeywell.com>
Message-ID: <31AC8B9E.F8C@HBC.Honeywell.com>
Source record: 22234

Dear Fellow Amateur Radio Operator:

I have just received the following advanced copy of the July 1996 QST editorial written by K1ZZ from Tod Olson, K0TO, and it focuses on an issue near and dear to many of us - specifically, the potential loss or sharing of our VHF and UHF frequencies with commercial services.

Please do three things TODAY -
1. Read the editorial.
2. Write letters to those listed in the editorial. Be rational and not emotional. Tell them sharing is not in the public interest.
3. Pass the editorial on to as many other concerned folks as you can.

Experience shows that what works best is MANY, MANY filled mail bags to governement officals. Post cards work well too - but the objective is to get a large volume of mail to these folks real quick and make sure they shift
their interests to someone elses frequencies and not OURS!

By your help ... and letter writing right now, we can help protect our frequencies and make sure we have the capabilities in the future to continue
to serve the public good! Write TODAY!

73, Carl Estey WA0CQG

==========Beginning of editorial==========

Write Now!

Get out a pen and paper, or boot up your computer. There's work to be done! Your help is needed to defend two meters and 70 cm. Yes, that's right -- the two most popular and crowded amateur VHF/UHF bands! But don't panic, and don't "go ballistic."

Here's what's happening, and what you can do about it. The United States is preparing for the 1997 ITU World Radiocommunication Conference, WRC-97. In the past, the public has been able to participate in the preparations for such conferences by responding to FCC Notices of Inquiry.
In March, the FCC announced a streamlining of its International Bureau's preparatory processes for WRCs. Under the new scheme, the NOIs have been eliminated in favor of increased emphasis on WRC Advisory Committees.

For WRC-97, a series of Informal Working Groups (IWGs) of the Advisory Committee has been created to address specific agenda items. The output of each IWG will go directly to a joint FCC-NTIA-Department of

State
Steering Committee of the Advisory Committee. There, draft proposals as
received from the IWGs will be reviewed and forwarded to the FCC for
possible
release as preliminary U.S. proposals for public comment.

In announcing the streamlined WRC preparatory process, the FCC tried
to reassure those who might be concerned about reduced opportunities for
public participation: "Interested parties should note that input to the
Advisory Committee may be sent at any time directly to the Chair of the
WRC-97 Advisory Committee; the Chairs of the Advisory Committee's
Informal
Working Groups; Cecily C. Holiday, the FCC's federal officer of the
WRC-97
Advisory Committee, or to Damon C. Ladson, the alternate federal
officer."

Hold that thought while we shift gears to the substance of the
issue.

One of the WRC-97 agenda items includes consideration of possible
additional frequency allocations for the mobile-satellite service.
So-called
"little LEOs," low-earth orbit satellites below 1 GHz, already have
allocations. Their proponents claim these are inadequate and are trying
for
more. The needs of little LEOs are being addressed in IWG-2A, chaired by
Warren Richards of the Department of State. The ARRL technical relations
staff participates in IWG-2A to represent Amateur Radio interests.

At the May 7 IWG-2A meeting, an industry representative proposed a
list
of "candidate bands" for little LEOs. The list includes a number of bands
that would negatively impact existing services, and does not include
others
that would be technically more feasible but to which strong objection
from
incumbents could be expected -- the point being that some political,
rather
than purely technical, judgment already has influenced the list.

Incredibly, 144-148 and 420-450 MHz were included on the list! This
is
the first time in memory that another service has been proposed for the
two-meter amateur band. We must make sure it is also the last time.

We do not need to explain to ARRL members the extensive use that is
made of these bands by amateurs. The two bands provide the backbone of
our
local public service communications effort. Voice and data, mobile and
fixed, even television -- the list of present amateur uses is a long one,
and of future uses is even longer. Both are already used for satellite

services and for moonbounce and extended-range terrestrial operations requiring extremely sensitive receivers and high levels of effective radiated power.

Apparently we did need to explain all this to the little LEO industry representatives, so we did just that -- both at the meeting and in a followup letter on May 15. We also explained that we had to regard the matter as extremely serious. No one with the slightest background inradiocommunication could possibly believe that a mobile-satellite service could be introduced into either band without disrupting existing and future amateur operations. Therefore, we said, if we did not receive assurance that they would be taken off the list of candidate bands by the deadline for this issue of QST, we would have no choice but to bring the matter to the attention of the entire membership.

The response we received was unsatisfactory. In effect, we were told the little LEO industry would consider our views but that until their spectrum needs are satisfied, all bands must remain under consideration.

So, this is a call to action. We must get across to the industry and government participants in IWG-2A that the 144-148 MHz and 420-450 MHz bands cannot be considered as candidates for mobile-satellite services. We need to drive the point home so forcefully, with so many grassroots responses, that no one is ever tempted to try this again.

Which brings us back to that invitation for "interested parties" to send input "at any time." There's no time like the present! Here are the key addresses, including those of the mobile-satellite industry folks who seem to have started the ruckus:

Cecily C. Holiday, International Bureau, FCC, Washington, DC 20554; choliday@fcc.gov; FAX (202) 418-0748.

Warren G. Richards, Chair, IWG-2A, Department of State, CIP 2529, Washington, DC 20520; richardswg@ms6820wpoa.us-state.gov; FAX (202) 647-7407.

Tracey Weisler, FCC Rep., IWG-2A, International Bureau, FCC, Washington, DC 20554; tweisler@fcc.gov; FAX (202) 418-2824.

Mary Kay Williams, Final Analysis, Inc., 7500 Greenway Center, Ste. 1240, Greenbelt, MD 20770; FAX (301) 474-3228.

Leslie Taylor, President, LTA, 6800 Carlynn Court, Bethesda, MD 20817; ltaylor@lta.com; FAX (301) 229-3148.

Do comment. But be civil. Don't abuse people who are
simply doing their jobs. We have to get across that casting
covetous eyes on amateur bands is counterproductive, and
contrary to the public interest. To accomplish this we
need a lot of comments, including yours. But remember that
the objective is to educate and persuade, not to intimidate. We
don't need to. The facts are on our side.

To monitor the FCC's ongoing WRC-97 preparations, visit
its WRC-97 home page at: http://www.fcc.gov/ib/wrc97/.
Write now. Right now! -- David Sumner, K1ZZ

> 73 SV1CVY Michael

Michael. You can generate your own keps for these sats, if you know
the longitude. Set the following:
Mean Motion 1.002738 (this is the only critical value)
Eccentricity 0 (or ,001 if the program blows up with zero)
Inclination 0
Argument of Perigee 0
Mean Anomaly 0
Epoch - any convenient time, like midnight: 96150.000
RA of Node - compute RA of sat longitude at chosen epoch.

WinOrbit provides a menu choice to automate the process. Other tracking
programs may do likewise. (WinOrbit, Satellite window, Edit, Special
Menu:"Make Geosynchronous", then enter the longitude. Conversion to
Right Ascension is done for you).

Subject: TVRO KEPLERIAN DATA info ?????

Dear Amateur

I would like to ask you if there is a site somewhere in www. or internet
to get keplerian data for tvro sat. for Europe like
Astra A, Astra B,C,D,E, eutelsat 2F1,2F2,Intelsat 601 etc.....
I receive kep.data from ARRL through the ham-space@ucsd.edu but I can not
locate these european tvro sats in their contents (catalog number).

I am also a subscriber to" satellite times" and "AMSAT Journal" but I have not
seen anything in these magazines about those sats.

Thank you in advance

You can find them on TS Kelso's site, look in this newsgroup for details.
(he regularly posts Shuttle and Amsat keps here, but more is available
by FTP)

>intend to work both digital and analog birds? Why?

When you don't have the antennas yet, look at the Maspro set (WHS32 I think)
which has polarization switching built in.

I have operated a pair of crossed yagi's for some years and had them
fixed at RHC, but sometimes performance was very poor, especially on 2M.
That may have been because of polarization mismatch at that time.
(owners of switchable systems often report that the optimal sense
varies, e.g. between the first and second half of the pass)

Ref. 2Line data for TV-sats, I got here in the same Ham-Space one address
vy. interesting: try(telnet) oig1.gsfc.nasa.gov.
The user is OIG and the password is Goddard1.
As the guy that posted such info said(I don't remember who, sorry), its
acessible tru telnet and its possible to "read" several TLE files as text
files.
At the file geo.tle you find both TVRO and other stationary birds since
the sixties (they still there in the sky, anywere...)
Good luck - Marcus - PY3CRX@SP-GW.PY2BJO.AMPRORG - Sao Paulo - Brasil.

I saw in "SpaceNews" that in mid-April the configuration settings on the bbs tnc were lost. It was estimated that the bbs (r0mir and r0mir-1) would be back up in a couple of weeks. I checked again today and still find r0mir to be down. I have not seen anything written up about it since that origninal report. I suggest checking the SpaceNews, and MIR reports on packet. I wish us all luck. I can report that during April I heard Shannon contacting stations on voice on 145.55. It was on a weekend night, about 2200 to 0100 hours Pacific time.

Check out the "Antenna Engineering Handbook" by Jasik and Johnson. One thing you want to pay attention to with any of these omnidirectional circular polarized antennas is how the CP holds up versus elevation angle.

1029. Helical antennas not popular?

Newsgroup: rec.radio.amateur.space
Date: 1996-05-31 00:00:00 UTC
From: bpaul@qualcomm.com
Message-ID: <bpaul-3105961031190001@wpaul-toy.qualcomm.com>
Source record: 22246

I hope to get into satellite communications soon, so I'm fantisizing the antennas at this point. After reading the ARRL antenna book, I am attracted to the idea of helical antennas for satellite work. My questions are:

From what I hear and read on the net, it seems crossed yagis are more popular than helicals, Why?

It seems that most work is done with right hand circular polarization, so wouldn't a helical be a good choice?

Thanks
-BP

Bill Paul KF6BBL San Diego,CA bpaul@qualcomm.com

>how do I determine which polarisation I get? I have been trying to
>figure it out for myself, but I can't agree with myself. The ARRL
>antenna handbook wasn't much help, I'm afraid..

This is tricky business...
It is explained in The satellite Experimenter's Handbook by Martin
Davidoff (recommended for any satellite experimenter, published by ARRL),
but that also includes the following quote after a 3-page explanation
with pictures:

"The analytic procedures outlined for determining the polarization sense
of a crossed Yagi or similar array may leave your brain feeling like
it's been spin modulated. Don't worry; you're in good company - the
telecommunications engineers setting up the first satellite transatlantic
TV broadcast via TELSTAR, for example, built a link with RHCP at one end
and LHCP at the other!"
It further describes how you can build a small helix to verify what
you have concluded after a lot of figuring and twisting :-)

Isn't there someone out there who knows how to remove that user from
the mailing list? Or how to educate the "ucsd usenet gateway" not to
bounce error messages to the news group?

Is is getting annoying to have those bounced digests (sometimes including
copies of earlier bounced digests) on the newsgroup. When it really
gets out of hand it could end in a dangerous chain reaction.

[2m and 70cm band on list for possible LEO allocation]

>So, this is a call to action. We must get across to the industry and
>government participants in IWG-2A that the 144-148 MHz and 420-450 MHz
>bands cannot be considered as candidates for mobile-satellite services.

You should know that other regions have only the 144-146 and 430-440
segments allocated to amateur radio. And the latter is not even fully
available in some European countries, and there is a constant threat
of 2MHz segments being scraped off it in many other countries. So, in
a way, you can only consider yourself lucky.

The adjacent bands (that are inside the USA allocation) are very heavily
populated with commercial services over here. They do not seem to
be likely candidates for satellite operation. When those LEO services
are to be operating worldwide, the 144-148 and 420-450 bands do not seem
to be suitable candidates.

visees sont celles qui sont les plus fortement congestionnees et utilisees. D'autres bandes qui auraient ete aussi bonnes au point de vue technique, et qui n'auraient pas nui a quiconque, ne sont pas comprises dans la liste. Il semble avoir un but politique ou personnel quelconque derriere ca, mais qu'importe la raison, ces propositions ne devront jamais devenir realite. C'est la premiere fois, de memoire, qu'un autre service serait propose pour la bande de 144 MHz. Faisons en sorte que ce soit la derniere.

Les deux bandes amateur visees consitituent les pierres angulaires de nos activites de service au public. Bien plus souvent qu'autrement, ce sont ces bandes qui servent le plus sur un site d'un sinistre ou d'une urgence quelconque, ou lors des activites de communications pour les evenement communautaires. La phonie, les donnees numeriques, mobile, fixe, meme la television, et la liste se prolonge, autant dans l'immediat que dans l'avenir. Quelle logique y a-t-il dans ces choix??

Meme apres que l'ARRL ait explique ces enjeux aupres des representants de l'industrie, on ne recut pas plus d'assurances que nos bandes seraient retirees. Meme qu'il fut repete que jusqu'a ce que leurs besoins soient satisfaits, toutes les bandes resteront sur la liste. Ceci n'est pas satisfaisant pour nous.

Alors, on vous appelle pour votre assistance pour defendre NOS bandes. Nous devons faire pression aupres des autorites americaines et canadiennes pour que ces propositions meurent dans l'oeuf. Nous devons faire valoir notre position avec une telle force, avec un tellement grand nombre de reponses que plus personne ne sera tente de recommencer une telle betise. Il ne faut pas attendre WRC-97 pour combattre cette menace, IL FAUT COMMENCER MAINTENANT.

Voici une liste d'adresses des gens impliques dans cette affaire, y compris celles des gens de l'industrie satellite (commercial) qui ont pris partie dans cette menace:

Cecily C. Holiday, International Bureau, FCC, Washington, DC 20554,
E-MAIL: choliday@fcc.gov FAX: 202-418-0748

Warren G. Richards, President, IWG-2A, Dept. of State, CIP 2529,
Washington, DC, 20520
E-MAIL: richardswg@ms6820wpoa.us-state.gov FAX: 202-647-7407

Tracey Weisler, Representant FCC, IWG-2A, International Bureau, FCC,
Washington, DC, 20554
E-MAIL: tweisler@fcc.gov FAX: 202-418-2824

Mary Kay Williams, Final Analysis Inc, 7500 Greenway Center, Suite 1240, Greenbelt, MD, 20770 FAX 301-474-3228

Il y aurait aussi Industrie Canada, qui pourrait etre interesse. Ou votre depute federal. Envoyez-leur vos commentaires,

en autant qu'ils sont polis. Si vous etes capables de faire vos arguments d'une facon intelligente et sans recourir aux insultes et aux menaces, c'est d'autant plus efficace pour attirer l'attention. L'objectif, c'est d'eduquer et de persuader, et non d'intimider, car les faits sont de notre cote.

Les preparatifs pour WRC-97 peuvent etre consultes sur le site WWW de la conference: http://www.fcc.gov/ib/wrc97/

Ecrivez maintenant. C'est important.

[d'apres une serie de bulletins paquet de l'ARRL, et un editorial publie dans QST, Juillet 1996]

1037. Ariane 5 launch?

Newsgroup: rec.radio.amateur.space
Date: 1996-06-01 00:00:00 UTC
From: tskloss@acs.tamu.edu
Message-ID: <tskloss-0106961204070001@ppp1b-03.rns.tamu.edu>
Source record: 22254

Despite the VHF/UHF discussion which has taken prevalence on the rec.amateur.* newsgroups, has anyone been following the maiden Ariane 5 launch? I read that it was scheduled to lift off Thursday (5/30/96), or is it one week later?

Just curious. I understand that P3D is supposed to ride one of these sometime soon. How is its development going?

-tim skloss kc5dna tskloss@acs.tamu.edu

1038. KO-23 New User

Newsgroup: rec.radio.amateur.space

From: efrom@lancnews.infi.net
Message-ID: <4oq0vl$bue@nw101.infi.net>
Source record: 22255

I'm trying to work KO-23 and K0-25. My setup is two Crushcraft
vertical beams with
claimed 10 dbi gain, (4 elements 2 meters and 6 elements on 440). SSB
preamp, 100'
RG8U, downconverter into an FT-990. Kenwood 251A up using RG8X. .
PK-96 using
Wisp. I have trees. I can hear KO-23 and the PK-96 DCD light flickers.
But I get no data
either through Wisp or my packet program (Packratt for Windows). Is
the signal just too
weak and I really need CP antennas pointed with a satellite rotor? Or
should I at least be
able to copy data? Or could it be the trees?. Wisp seems to be working
well.
I thank you, my Mother thanks you, for any help.

Source record: 22257

Hi Bill....crossed yagis are a good choice simply because they can be reversed in circularity with a simple relay. Helical can not. If you confine your work to higher elevations where the circularity almost can be guaranteed to be right hand, helical work just fine! Cliff W6HDO/K7RR

*****ARRL NEW ENGLAND DIVISION SPECIAL BULLETIN 96-9A*****

QST to all Amateurs

May, 1996

Strafford, VT

NEW ENGLAND DIVISION DIRECTOR NEW ENGLAND DIVISION VICE DIRECTOR
Bill Burden WB1BRE Warren Rothberg WB1HBB
wb1bre@arrl.org wb1hbb@arrl.org

********** 2 Meter AND 70 cm BANDS THREATENED **********

THIS IS NO JOKE!! ARRL HAS LEARNED THAT IN PREPARATION FOR THE
WORLD RADIO CONFERENCE IN 1997, REPRESENTATIVES OF THE LOW-EARTH-ORBIT
(LEO) INDUSTRY PROPOSED A LIST OF CANDIDATE FREQUENCY BANDS FOR
REALLOCATION TO, AND EXCLUSIVE USE OF THE MOBILE SATELLITE SERVICE. THIS
LIST INCLUDES 144- 148 MHZ (THE CURRENT AMATEUR 2 M BAND) AND 420-450 MHZ (THE
CURRENT AMATEUR 70 CM BAND)!
IF THIS EFFORT WERE TO BE SUCCESSFUL, IT WOULD MEAN THE END OF
AMATEUR OPERATIONS ON THESE TWO MOST HEAVILY UTILIZED AMATEUR VHF/UHF
BANDS!

I have included the text of Dave Sumner's upcoming editorial for
July QST in this bulletin. ARRL, as the principal representative of
Amateur Radio in Washington, is actively pursuing this issue as this
bulletin is being written. Dave's call to action is serious!! We could lose these bands if
we do not take action now!!
Club presidents and newsletter editors: please make this
information available to your membership as soon as possible.

Follows the text of Dave Sumner's July QST editorial:

WRITE NOW!!!!

Get out a pen and paper, or boot up your computer. There's work to be done! Your help is needed to defend two meters and 70 cm. Yes, that's right -- the two most popular and crowded amateur VHF/UHF bands! But don't panic, and don't "go ballistic."
Here's what's happening, and what you can do about it.
The United States is preparing for the 1997 ITU World Radiocommunication Conference, WRC-97. In the past, the public has been able to participate in the preparations for such conferences by responding to FCC Notices of Inquiry. In March, the FCC announced a streamlining of its International Bureau's preparatory processes for WRCs. Under the new scheme, the NOIs have been eliminated in favor of increased emphasis on WRC Advisory Committees.
For WRC-97, a series of Informal Working Groups (IWGs) of the Advisory Committee has been created to address specific agenda items. The output of each IWG will go directly to a joint FCC-NTIA-Department of State Steering Committee of the Advisory Committee. There, draft proposals as received from the IWGs will be reviewed and forwarded to the FCC for possible release as preliminary U.S. proposals for public comment.
In announcing the streamlined WRC preparatory process, the FCC tried to reassure those who might be concerned about reduced opportunities for public participation: "Interested parties should note that input to the Advisory Committee may be sent at any time directly to the Chair of the WRC-97 Advisory Committee; the Chairs of the Advisory Committee's Informal Working Groups; Cecily C. Holiday, the FCC's federal officer of the WRC-97 Advisory Committee,on C. Ladson, the alternate federal officer."
Hold that thought while we shift gears to the substance of the issue.
One of the WRC-97 agenda items includes consideration of possible additional frequency allocations for the mobile- satellite service. So-called "little LEOs," low-earth orbit satellites below 1 GHz, already have allocations. Their proponents claim these are inadequate and are trying for more. The needs of little LEOs are being addressed in IWG-2A, chaired by Warren Richards of the Department of State. The ARRL technical relations staff participates in IWG-2A to represent Amateur Radio interests.
At the May 7 IWG-2A meeting, an industry representative proposed a list of "candidate bands" for little LEOs. The list includes a number of bands that would negatively impact existing services, and does not include others that would be technically
more feasible but to which strong objection from incumbents could be expected -- the point being
that some political, rather than purely technical, judgment already has influenced the list.
Incredibly, 144-148 and 420-450 MHz were included on the list! This is the first time in memory that another service has been proposed for

the two-meter amateur band. We must make sure it is also the last time. We do not need to explain to ARRL members the extensive use that is made of these bands by amateurs. The two bands provide the backbone of our local public service communications effort. Voice and data, mobile and fixed, even television -- the list of present amateur uses is a long one, and of future uses is even longer. Both are already used for satellite services and for moonbounce and extended-range terrestrial operations requiring extremely sensitive receivers and high levels of effective radiated power.

Apparently we did need to explain all this to the little LEO industry representatives, so we did just that -- both at the meeting and iup letter on May 15. We also explained that we had to regard the matter as extremely serious. No one with the slightest background in radiocommunication could possibly believe that a mobile- satellite service could be introduced into either band without disrupting existing and future amateur operations. Therefore, we said, if we did not receive assurance that they would be taken off the list of candidate bands by the deadline for this issue of QST, we would have no choice but to bring the matter to the attention of the entire membership.

The response we received was unsatisfactory. In effect, we were told the little LEO industry would consider our views but that until their spectrum needs are satisfied, all bands must remain under consideration.

So, this is a call to action. We must get across to the industry and government participants in IWG-2A that the 144- 148 MHz and 420-450 MHz bands cannot be considered as candidates for mobile-satellite services. We need to drive the point home so forcefully, with so many grassroots responses, that no one is ever tempted to try this again.

Which brings us back to that invitation for "interested parties" to send input "at any time." There's no time like the present! Here are the key addresses, including those of the mobile-satellite industry folks who seem to have started the ruckus:

Cecily C. Holiday, International Bureau, FCC, Washington, DC 20554; choliday@fcc.gov; FAX (202) 418-0748.
Warren G. Richards, Chair, IWG-2A, Department of State, CIP 2529, Washington, DC 20520; richardswg@ms6820wpoa.us-state.gov; FAX (202) 647-7407.
Tracey Weisler, FCC Rep., IWG-2A, International Bureau, FCC, Washington, DC 20554; tweisler@fcc.gov; FAX (202) 418-2824.
Mary Kay Williams, Final Analysis, Inc., 7500 Greenway Center, Ste. 1240, Greenbelt, MD 20770; FAX (301) 474-3228.
Leslie Taylor, LTA, 6800 Carlynn Court, Bethesda, MD 20817; ltaylor@lta.com; FAX (301) 229-3148.

Do comment. But be civil. Don't abuse people who are simply doing their jobs. We have to get across that casting covetous eyes on amateur bands is counterproductive, and contrary to the public interest. To accomplish this we need a lot of comments, including yours. But remember that the objective is to educate and persuade, not to intimidate. We don't need to. The facts are on our side.

To monitor the FCC's ongoing WRC-97 preparations, visit its WRC-97
home page at: http://www.fcc.gov/ib/wrc97/.

1045. NORAD Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1996-06-03 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4otrnt$8ql@blackbird.afit.af.mil>
Source record: 22262

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system. In addition, element sets (updated daily) and some documentation and software are also available via anonymous ftp from

archive.afit.af.mil (129.92.1.66)

in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
```

(Letters, blanks, periods, plus signs = 0; minus signs = 1)

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Actual schedule for first Ariane 5 liftoff is TUE, 04.June. 1996. But who knows what finally happens.....
P3D is to ride on SECOND flight of Ariane 5 - OR on any Ariane 4 flight BEFORE July 1997, if it cannot go with Ariane 5 Flight 2 due to any reason.
It is a signed contract that P3D will have a lift in any case, latest mid 1997.
However, supposed flight with A-5 No.2 will not be earlier than Sep. 96.

The antennas are smallish, but it should be possible to do something.
Elevation control is of course required, or else the antennas should
be elevated about half the -3dB angle.
You should have a strong signal. S-meter reading is probably bogus
with a converter inline, but I would say it should be S-7 or above.
Also the connection of the TNC to the transceivers should be OK for
9600 baud. Verify this by connecting the local node or bbs, or another
user. You should be able to transfer files in both directions (at
PACLEN 256) without difficulty.

When my system was still working I used 2*15 el crossed yagi on 70cm
and had a steady signal most of the time.

You can't change polarization on a helical like you can crossed
yagis. If you're working in the sidelobes of a circular-polarized
downlink, they may have opposite polarization! OSCAR 10 was a
real pain sometimes without a polarity switch, because the antenna
was not always pointed geocentrically.

1052. Re: Our VHF/UHF frequencies at risk - again!

Newsgroup: rec.radio.amateur.space
Date: 1996-06-04 00:00:00 UTC
From: bytomatic@aol.com
Message-ID: <4p0prl$k79@newsbf02.news.aol.com>
Source record: 22269

Msg #595 From: W3MM
Date: 31-May 1614Z
Subj: state dept hostility
Copy of message. From: WF3H To: ALL Date: 31-May-1996 1614Z

One of the people heading up the effort to reallocate our freqs is Warren Richards of the state dept. I called him today (202 647 0049) to express my concern and to get more info. This guy was very very hostile, saying the ARRL is spreading "bullshit". He accused hams of trying to intimidate him (we wouldnt do that, would we?), and said "do you know how many GODDAMN emails I have from you people? (email richardswg@ms6820wpoa.us-state.gov). He also said he wasnt interested in our opinions, and that the freqswill continue to be considered for reallocation.

And another message...

From: bytomatic@aol.com
To: richardswg@ms6820wpoa.us-state.gov
Subject: Forget About Amateur Frequencies!

It is my opinion that you are a fool for advocating the reallocation of the two meter and seventy centimeter amateur bands to serve the interests of the LEO comsat industry. These frequencies are heavily populated by licenced radio amateurs throughout the world and will not be given up without a fight.

You sure as hell will not see me givace of the earth says so AND my last piece of transmitting equipment is wrenched from my cold, dead, powder burned hands.

Philip Collier,
KG2DH

1053. Dove -17

Newsgroup: rec.radio.amateur.space
Date: 1996-06-04 00:00:00 UTC
From: trandall@mhv.net
Message-ID: <4p1337$khd@news.mhv.net>

What is the status of Dove-17? I recently monitored a pass and received nothing from her.

Thanks,

Tom

1054. Ariane 5 Fails

Newsgroup: rec.radio.amateur.space
Date: 1996-06-04 00:00:00 UTC
From: greenberg@courier8.aero.org
Message-ID: <greenberg-040696090813@greenberg-t.aero.org>
Source record: 22271

The following news was found on the Florida Today (Space Today) web site at
http://www.flatoday.com/space/today/

Mission Briefing: June 4, 1996

Update for 9:15 a.m. EDT: BOARD TO PROBE ARIANE 5 FAILURE

An inquiry board is forming to investigate the explosion of the Ariane 5
rocket
shortly after its maiden launch from Korou, French Guiana this morning.
Launch
took place about 8:35 a.m. EDT.

The rocket appeared to pitch to the left 34 seconds into flight. It
exploded
seconds later at an altitude of 4,000 meters. No injuries were reported on
the
ground. Launch officials said debris fell into a protected area.

No immediate reason was given for the explosion which deals a crushing blow
to
the European Space Agency's attempt to take command of the international
commercial launch market. The Ariane 5 was 10 times as powerful than the
Ariane
4 rocket it was expected to replace. It was carrying a half-billion dollar
package
of four Cluster satellites to study the Earth's relationship with the Sun.

1055. What happens now (Ariane 502)?

Newsgroup: rec.radio.amateur.space
Date: 1996-06-04 00:00:00 UTC
From: joachimp@stud.unit.no
Message-ID: <4p1lkr$aoh@due.unit.no>
Source record: 22272

Just wondering what Amsat is thinking of doing now that Ariane 501
failed? (It blew up just after take off today). Will it go on a Ariane 4
launch, and in case when, or will Amsat risk launching it with an
unproven launch vehicle?

>downlink, they may have opposite polarization!

I took the polarity relay off of my KLM2M14C because it was too unreliable
and I almost never had a reason to use LHC. I also suspect these relays
insert a significant loss, particularly at UHF. I have heard the polarity
change on 435 with the FO-20 satellite is important but I haven't checked
that yet.
I suspect that most hams don't use helix antennas because most hams these
days buy their antennas and nobody sells a helix.
I have a Cushcraft AO-18 435 Mhz crossed yagi that seems to have so many
sidelobes and a generally lousy pattern that I'm thinking of building
a RHC helix instead. But I probably need to test the Cushcraft some more
out in the open instead of all these trees and hills.

I Have received 2nd hand info that AO27/Eyesat is on a new operating
Mode - something on the order of only 5 minutes QRV
after entering daylight. Can anyone edify this "rumor"?

Tnx

RELAX Folks....

Would an Industry really place MONEY MAKING mobile sat LEO's on bands already accessed by millions of Amateurs world-wide???? Come on folks..it just won't happen....you honestly think that even if the IMPOSSIBLE, cease and desist order from our FCC on using the 2mtr and 70cm bands, that everyone will just quit....I'd say the LEO's would most like get unintentionnal and intentional interference from a million land based radios, world-wide?

Just because a company wants to experiment using certain frequencies using leo's and new modes of modulation and digital services, doesn't mean that they are going to use that full spectrum exclusively.....

Just relax guys...we won't loose anything here...besides, the US and Canada hams arn't the only one's using these freqs...this LEO freq allocation request will have to battle every Country, not just No. America, since LEO's receive and transmit farther then most Country boundaries...

In addition to what is stated above, which is of some questionable usefulness, is the matter of gain. Now I know that forward gain is not the only factor with an antenna, but for sat comm it is an important one.

From what I have read (no personal measurements) the gain equations for helical antennas commonly seen are optimistic. The Antenna Handbook as well as the Satellite Experimenters Handbook both mention this I believe. I am going from memory, but I believe that I have seen a "rule of thumb" that a helical needs to be one-third to one-half again as long in wavelengths as a crossed yagi (no offset) system to produce the same forward gain.

I am planning on doing some experimentaion, but need the time and range to do so. I'd really like to see some more "real world measurements" published, since the texts I've seen state this is lacking.

Cross yagis are more compact and easier to implement. A Helix
for two will require lots of fiberglass or other waterproof
material for the boom and the struts.

John,
So what is the difference?
It is still a unproven launch truck
it was still destroyed.
its payload is destroyed

I used to think that it was terrible that life was so unfair. And then I
thought, 'What if life were fair?' Then all the terrible things that
happened to us would be because we deserved them. I take great comfort in
the general hostility and unfairness of the universe.
Markus Cole, paraphrased

1068. Question About 9600 Baud FSK Packet

Newsgroup: rec.radio.amateur.space
Date: 1996-06-05 00:00:00 UTC
From: Lindsay <efrom@lancnews.infi.net>
Message-ID: <31B5C141.7225@lancnews.infi.net>
Source record: 22285

A brief question about 9600 baud satellite packet.
Will a Yeasu FT-990 (or any HF transceiver with a packet port)
pass a 9600 baud satellite packet signal through the
rear packet port, if it has been downconverted
from 435 megs to 28 megs (FM)? I want to pass
the signal through to my TNC. Thanks for your
help.

1069. Re: Helical antennas not popular?

Newsgroup: rec.radio.amateur.space
Date: 1996-06-05 00:00:00 UTC
From: "F. Kevin Feeney" <fkf1@cornell.edu>
Message-ID: <4p4sc1$pg8@newsstand.cit.cornell.edu>
Source record: 22286

I too have heard that helicals gain figures are optimistic, in fact I think there is a more in depth treatment of helicals in the latest antenna compendium, volume 4 I believe.

On the other hand, I built a 70cm band,14 turn, 10 foot long helix for about $25 (mostly the cost of the tubing) and it' s been running for 4-5 years now. I can hear myself on oscar 13 with one watt when angles are good, sometimes keying with slow morse on an ht ptt switch for fun. I can hear VE3ONT moonbounce on it on my FT736 with no preamp (not real well, but it was a thrill anyway) It seems to have a good pattern, no weird lobes or anything that I"ve noticed. So far I haven't seen a need for LHCP. It was pretty forgiving to construct compared to a yagi.

In side by side (well 50 miles apart) with a similar station running barefoot FT736 into a 40CX crossed yagi, we had equivalent signal strengths - so it's competative with antennas others are using.

You might also consider just using linear polarization - most of the europeans I talk to use that. One of the biggest signals on the bird, G4JUJ (haven't heard him around in a while - where'd he go?) told me he used two linear antennas for each band, slaved together by bicycle chain, and he rotated the pair of antennas in polarization until he got the best signal - whatever polarization it was. CP antennas seem to be a primarily American phenomena.

YMMV

I didn't mean to imply a helix for 2 meters, but rather for 3/4 meters.
Apparently it is not so easy to design and implement even a linear yagi
on this band. My Cushcraft AO-18 is an example.

Has anybody got any good simulations for a helix? My modeling program
by K6STI will not support enough segments to do more than a couple of
turns.

The appearance of a helix antenna is enough to make me try it.
Reminds me of the old NASA ground stations.

I recently stumbled across a web page about Picosats at
www.cordis.lu/esprit/src/picosat.htm
This project is apparently endorsed and/or sponsored by a European
group called Esprit, with (it appears) blessings from the EC. It looks like an
interesting project with a lot of potential. Has anyone else seen it? Does it
look like it's as 'do-able' as is claimed? (If you haven't seen
the web page, give it a look. My curiosity chip is on overdrive on this
subject.)

On a similar vein, how does this apply to the apparent threat to the
Amateur 2m/70cm bands? If the Powers That Be are actually considering
changing these bands - apparently on a worldwide basis - would the
Europeans even be considering this project? Lastly, would it help
our cause to support this kind of thing?

Hi there,

i have a technical question for SPACE specialists.

My question is:

There is a satelite, on 103.7 defrees west, and I wonder if I can receive it,
here in Istanbul - Turkey??

Is there anyone who can calculate this for me??

Is there a program that enables me to see the footprint of this satellite??

I have INSTANT TRACK here, but i don't have the KEPPLER data for this
satelite, so I'm lost here.

HELP!!!

Thanks for helping me.

Please send your reply to herksen@ibm.net as I don't visit this group

It makes quite a bit of difference. One indicates a guidance problem the other an engine/fuel problem.

Latest word is that it is a guidance problem and may be software related.
I agree the problem is not serious, not like an engine that failed. It
will be fixed quickly and the program will go on.

From what I hear, the matching networks are difficult to make effecient.
That was the impetus behind the quagi by wayne overbeck. He went with the
loop elements to come up with a simple effecient feed, and then yagi
directors to do the rest. The first iteration apparently used a
commercial antenna with the last two elements lopped off and the quad
elements put in their place.

I've had good luck with a 5 element 2 meter quagi and a 10 element 70 cm
quagi for oscar 13. I used them before I got the helix built and the
klm14c, and built another set for field day portable operation.

>Has anybody got any good simulations for a helix? My modeling program
>by K6STI will not support enough segments to do more than a couple of

I made up a spreadsheet once in twin (lotus clone) that let me diddle
some physical dimensions while watching gain and others parameters. Its
not terribly complicated, but it let me work out things like a nice 10
inch diameter, x foot long helix with some gain estimates so I could see
the trade offs. Not sure if I could get it to you in a useable format,
but we could try sending it via email or ftp.

>
>The appearance of a helix antenna is enough to make me try it.

Indeed, it does look distinctive. I had an old B&W camera mounted up on
my crossbar so I could see where the antenna was pointing, and sometimes
I'd just watch folks walking down the street. They seemed to get nervous
with the 'James Bond Deathray' tracking them. I was going to put some
sort of glowing red tube down the center of it to enhance the effect, but
never got around to it. :-)

I pulled this excerpt from _Jonathan's Space Report_ on sci.space.news

Jonathan's Space Report
No. 289 1996 Jun 5 Cambridge, MA

...
Recent Launches

The first launch of the new Ariane 5 rocket, mission V501, ended with destruction of the rocket after 40 seconds of flight, at an altitude of 4000 m. The vehicle pitched over and then was destroyed by the range safety officer. It is not yet known whether the problem was in the main stage or the solid boosters.

Ariane 5 consists of two P230 Aerospatiale EAP (Etage Acceleration a Poudre) solid strapon boosters, the Aerospatiale/SEP EPC (Etage Principal Cryotechnique) cryogenic main stage, and the Daimler-Benz EPS (Etage 'a Propergols Stockables) storable liquid propellant upper stage with an L9.7 Aestus engine. The design is completely different from the Ariane 1 through 4 family which shared a common core stage with evolutionary modifications. First flights of large launch vehicles are very rare - Ariane 1 in 1979, Shuttle in 1981, Energiya in 1987, H-2 in 1994. This is the only failure of a large core stage on initial flight apart from the Russian N-1 moon rocket in 1969 and the first launch failure of a major space science payload since Mariner 8 in 1971. My best wishes and condolences to those of my friends working on the Cluster project. For comparison, I list below the history of initial launch attempts of new orbital rocket designs.

I used to work at a Nasa ground station (Winkfield Minitrack Station,
later called a STADAN Station (Sat Tracking and Data Acquisition
Network)). We used Crossed Yagis as we used both left and right circular
polarisation into diversity combiners. This was at 136 Mhz.

It depends on the satellite height (or orbital period).
Popular algorithms include SGP4, SDP4 as described in "Spacetrack Report No. 3, Models for Propagation of NORAD Element Sets", F. R. Hoots and R. L. Roehrich, December 1980.

The "TLE Mean" model can be used for satellites above a certain height.

Detailed writeups of satellite calculation formulas and programs have (in the amateur radio community) also been made by W3IWI, HB9CVT and ON6UG.

1093. Radio Meteor Obs. Bull. May 1996: eta Aquarids, sporadic-E

Newsgroup: rec.radio.amateur.space
Date: 1996-06-07 00:00:00 UTC
From: steyaert@vvs.innet.be
Message-ID: <steyaert.69.31B82116@vvs.innet.be>
Source record: 22308

Radio Meteor Observation Bulletin No. 34 June 1996

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.41 Siedlce Poland 39 04h57(Sun05h57)-02h00(Sat03h00)
66.47 Viesintos Lithuania 12 05h00-22h00
66.50 Sofia Bulgaria 10 24hrs
66.56 Poznan Poland 56 04h57(Sun05h57)-02h00(Sat03h00)
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 06h00-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 o (= East),
elevation 27 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB

Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

May 1996
Eta Aquarids

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:

. local time = UT + 2 hours
. * extended activity period of the eta Aquarids May 5 - 8.
The radiant of the eta Aquarids rises at 1h30 UT, and culminates
at 7h30 UT.
. early start of the sporadic-E season this year

Maurice De Meyere / Chris Steyaert

Observer: Werfried Kuneth
Location: Villach, Austria (13 53' E, 46 37' N)
Antenna: dipole with reflector, direction east.
Receiver: AR-8000 SSB mode, narrow passband filter, no preamplifier.
Frequency: 59.2505 MHz,
Transmitter: 150 kW TV video carrier in Bucaresti,
Romania, distance 950 km, east direction.
Observing method: the audio signal is fed into a real time FFT display
(FFTDSP38 program from AF9Y) on the PC where 640 channels of 2Hz width
are recorded and stored continuously. Every meteor reflection produces
a distinct whistle, which is recorded easily by the real time FFT
program in .GIF pictures of 200 seconds each.
From the 1280 Hz wide received picture only one channel of 40 Hz width

is used for meteor identification, the other nearby "channels" are used to monitor interference, which can be identified easily. If any interference occurs, the whole 200 second recording of one frame is skipped.

The following figures show the total length of the meteor reflections during one hour, expressed as percentage. The number here shows 10 times this value. (e.g. 100 means 10 percent).

May 1996
```

Notes:
. blank value means no data available, interference or sporadic "E".
. local time conversion: 2 hours ahead of UT (06h00 UT is 08h00 local)
. for further information: http://www.net4you.co.at/user/kuneth/info.html
. Es (sporadic "E") signatures have been found on the following days, making the radio meteor reception difficult (valid only for the observatory location, beaming east, like the meteor reception path, on 59 MHz):

May 18 to May 23: Es at least once
May 24 to May 28: observatory offline
May 29 to May 31: no Es

Werfried Kuneth

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 30 degs
Antenna amplifier: 10 dB gain
Frequency: (1)=66.29 MHz (signal) and (2)=65.3 MHz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2) tuned at empty frequency. Anticoincindence measurement rejects registration of broadbanded spurious signals (lightnings, computers, ingition motors, etc).
Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html

Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic E.

Notes:
. lots of sporadic-E between May 18 and May 27.
. eta Aquarids activity between May 4 and May 8.

Paul Vauterin

Observer: Chikara Shimoda
Location: Asahi,Nagano,Japan (137 51' E, 36 07'N)
Frequency: 81.4 MHz
Transmitter Locations: FM-Japan 81.3 MHz, 10 kW, distance 180 km
Antenna: 5 element Yagi directed to the Zenith.
Receiver: AM-FM Tuner (TRIO KT-1100)
Observing method: Meteor echoes output from center-tuning meter were
recorded on a pen-recorder chart.

2. ANNOUNCEMENT

The "UKW-TV-Arbeitskreis der AGDX e.V." (VHF-TV Working group of the AGDX) produces a monthly electronic newsletter with European VHF stations updates.
Contact Onken Ulrich MSM PH43 CH <ulrich.onken@chbs.MHS.CIBA.COM> for further information.

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and has gradually been expanded.

Typically it contains: summaries of recent observations, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

It's been too long since I last looked, but I believe that Kraus in his first edition of _Antennas_ expressed the characteristics of the helical antenna in terms of directivity instead of gain. I suspect that somewhere along the way someone applied the old "directivity equals gain" notion in retelling the results of Kraus' work, thus setting the stage for "optimistic gain equations."

> I am planning on doing some experimentaion, but need the time and range to do

I'm not sure I agree that there's a lack of "real world" measurements - much of Kraus' early work on helical antennas was based on empirical measurements rather than theory (which may account for some errors in Kraus' directivity results). I think that back in the '70s some systematic measurement of helical antennas was performed by a couple of individuals at The Aerospace Corporation; doggone it if I can't remember where that information can be found. If someone is interested, I could find the reference...

I wouldn't go that far. Bill Gates is involved in this and he has more money than some countries. I agree chances are slim, but not impossible.

sci.astro
From:

Dale Ireland <direland@olympic.net>

Once a year the orbit of the space station MIR and the Earth's
inclination combine to
produce a situation such that MIR nearly follows the day-night
terminator throughout
it's orbit and so is visible all night on every pass. It may be
possible to see as many
as 4 consecutive passes theoretically 5. This is the week! For the
next few nights
centered around June 8 MIR can be seen on nearly every pass. A
visibility list by
city may be found at the SKY and Telescope web site www.skypub.com.

I agree with John wholeheartedly. I found the equations for dimensions and gain calculations in both the antenna handbook and the satellite experimenters handbook - some parts of what I wanted in each. The radial match info came from one of those two books and a construction article I found, which didn't exactly agree with each other. A little headscratching and some experimentation got us to the finished version.

And weight is the big bugaboo. Mine is rugged, it's hit the ground 3-5 times so far (I kept trying cheap tripods to hold the whole mess up) and keeps on trucking, but it's twice as heavy as the 14C on the other end of the support arm. I get away by sliding the horizontal arm back and forth in my turned sideways U100 to find the balance point between the antennas, and clamp it there. Looks a bit asymetric, but after you've digested the helix, that's nothing. :-)

Source record: 22313

Just to add some real world experience to this discussion, I built a simple 10 turn RHCP helix antenna for 70cm. Some wood, #10 guage wire and 1/2" grid wire mesh for the reflector. As a transmitting antenna it has always had outstanding performance. With 50 watts of drive I have always been able to generate a downlink signal on AO-13 comparable to other stations heard using crossed yagis. As a receiving antenna for FO-20, UO-22, KO-23, KO-25 and AO-27 (with 40' of 1/2" heliax and cheap preamp/10m downconverter both in the shack) I have never had any problems on receive either. Aside from being fairly easy to build and match, the biggest advantage of a helix is often not mentioned, that is that for the amount of gain developed it has a very broad beamwidth, on the order of 20-30 degrees for a 10 turn version. This is an invaluable feature when using manually controlled antennas on LEO birds. My only advice to someone contemplating building one is to collect construction information from several different sources and take the best ideas from each. The prime goal during construction is to make it as light as possible.
YMMV

1099. NORAD Two-Line Orbital Element Sets (TLE822)

Newsgroup: rec.radio.amateur.space
Date: 1996-06-07 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4pa8bo$5k1@blackbird.afit.af.mil>
Source record: 22314

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Hate to do it but I just have no time to tweak my DSP93 as I need to get it going for sat work. SO I wish to trade it for a DSp2232 or 1232. It is built and works perfectly. Also includes the PACCOMM TNC board installed. Includes all docs and software.

Thanks for the bandwidth

Get me at bsmith@msn.com.

I've interfaced true TNC-2 TAPR header equipment to that header in the
PK900 David so I imagine it should work. Just Match the header outs to
the lisiting in the maunals and see if that works.

================================================================================
The Baltimore Radio Amateur Television Society will hold their annual
Field Day at the Baltimore County Fire/Rescue Academy Training Center
on York Road, just inside the I-695 Beltway at Exit 26 in Towson, MD.

The event begins at 2:00 pm. on Saturday June 22nd., and goes
continously until Sunday June 23d. at 2:00 pm. Amateur radio
operators are also invited to assist in the setup beginning at
8:00 am. on Saturday morning and after the event on Sunday afternoon.

Field Day is a conglomeration of a contest, an emergency
preparedness exercise (all operation is via generator or battery
power) and a public relations event to help publicize ham radio.
Please plan to join us and operate at least some of the time
between Saturday afternoon and Sunday afternoon. Plan to bring your
family and friends as well, and expose them to ham radio. (Licensed
operators will be on hand to assist them.)

Refreshments will be provided.

For more information, contact the BRATS at (410) 467-4634
home page: http://www.smart.net/~brats
e-mail: brats@smart.net

REMINDER: Enter only from York Road....and please don't park in an
unauthorized parking space. Talk-in is available on 2 meters-amateur
radio 147.63/03.

1106. Re: Helical antennas not popular?

Newsgroup: rec.radio.amateur.space
Date: 1996-06-08 00:00:00 UTC
From: Ron Lile <rel@bcl.net>
Message-ID: <Dsp844.4Il@bcl.net>
Source record: 22173

I can agree that helix are big for two meters
I have modeled them on EZnec, but find it just as easy to design them with a spread sheet or a calculator. There are equations around with sufficient accuracy for amateur use.

As to the materials, I have used at many frequencies aluminum for the boom and fiberglass road markers
for the strutts. 1.25 inch aluminum in either round of square cross section works out to about 10 -12 feet. The fiberglass is 3/8 inch diameter and costs only a few $ for 3 feet.

But, I still like crossed yagis because it is still smaller and is easier to change circularity. They are harder to make for <3 dB ellipicity though

See QEX ~ March 1994 about discussion on metal booms.

Sorry, but it's not as simple as this.
The gain and the beam width of an antenna are interrelated, and
independent of the design as long as the
antenna under test does not incorporate an attenuator or amplifier.
This is simple geometry.

Easy as cake! You need a good satellite tracking program for your
computer. THere are a bunch out there, including some free on-line
from NASA Spacelink. You need a source of Keplerian Elements
(you're at one right now) which are mathematical descriptions of
current satellite orbits. You type in, or automatically run in, the
elements. You need to set the location of your site and correct for the
time zone you live in. Bingo! The program will tell you where your
particualr satellite is at the present time, and when it will pass
overhead (or in range) again. Satellite tracking is interesting and fun,
too. Some good programs are Instant Track, Orbits, STS Tracker. There
are tons of other programs too, some more sophisticated, some less so.

What about the F/B ratio? The screen reflector of a helix has to
increase the F/B ratio considerably so that the energy that usually
escapes to the rear of any kind of Yagi antenna instead must find
another way. I won't argue the broad beamwidth vs. gain of a helix
because I don't know yet but I have to think that plane , parabolic,
and corner reflectors vs. passive reflecting elements on a Yagi
are an example of geometric factors not independent of the design.

1119. JVFax7.0

Newsgroup: rec.radio.amateur.space
Date: 1996-06-11 00:00:00 UTC
From: m.aschauer@magnet.at
Message-ID: <15470.6497783@magnet.at>
Source record: 22186

hi there,
the jvfax7.0 is a fine program for all meteosat users (not only for them).
the author eberhard backeshoff has made a good job, even in the design of
the overlay-maps.
But unfortunatly there are no borders for the different countrys.
Im searching for a overlay map (meteosat format d2 and c03) w i t h the
borders if all european states.
if youve any idea how to add this borders to the existing overlay maps,
please let me know.
thanks in advance
73,
Michael Aschauer

> How do I go about to track a satellite for example RS10?

Shareware tracking programs are available from many sources, including AMSAT via anonymous ftp. You'll need current orbital element sets, which describe the satellite motion. The data is posted in this newsgroup. Plug in the data and voila! satellite tracking made easy.

From: zachb@iastate.edu
Message-ID: <zachb.834512008@oper.cc.iastate.edu>
Source record: 22189

Hi,

I would appreciate some advice on which satellites I could talk to and hear using a FM only dual-band 2m/73cm mobile rig. I live in central Iowa (usually).

I have been playing with sattrack and find it quite useful. But I dunno which satellite I should be trying to hear/talk to. It seems 2m/73cm is a good combination, but mostly I've heard about ssb stuff, not too much FM, especially voice (not packet).

Are there any satellites which I could possibly hear and talk to (fm repeater type?) with my FM dual-band rig?

Thanks for the info!

SB SPACE ARL ARLS005
ARLS005 Phase 3-D update

Ariane 5 failure could affect Phase 3-D launch

The spectacular failure of an Ariane 5 launch vehicle, the same type of rocket that's scheduled to carry the Phase 3-D satellite aloft later this year, may have an impact on the Phase 3-D program. The rocket, on its maiden operational test, had to be destroyed June 4 by ground-based command 40 seconds into the flight at an altitude of about 12,000 feet (4000 meters) when it appeared to veer off course. The launch was from the European Space Agency's Kourou launch facility in French Guiana, South America. Ariane 501 carried a group of four scientific satellites known as ''Cluster'' which were destroyed as well. No Amateur Radio satellites were aboard.

The AMSAT Phase 3-D spacecraft, now under construction, is manifested on the second flight of the Ariane 5 series (Ariane 502) which, according to ESA's latest schedule, is to be launched in October of this year. AMSAT officials say it's too early to know what effect the Ariane 501 failure will have on the 502 schedule, the possible Phase 3-D launch date, or the vehicle on which it will ride. But they do not rule out a schedule that extends beyond the re-entry of AO-13 into the Earth's atmosphere.

AMSAT-DL President Karl Meinzer, DJ4ZC, and AMSAT-NA President Bill Tynan, W3XO, expressed their sadness on hearing the news. In a joint statement they said, ''We at AMSAT have enjoyed a mutually beneficial relationship with ESA for over 15 years, and we are, quite naturally, distressed to hear of this unfortunate occurrence.'' They noted that except for the RS and Fuji satellites, all successful Amateur Radio satellite launches since the early 1980s have been on Ariane vehicles. Both men expressed confidence that the ESA team will overcome this setback and develop a successful launch vehicle. DJ4ZC and W3XO said they stand together in anticipating a successful

launch of Phase 3-D on a future Ariane mission.

ARLS006 Field Day in space?

During this year's ARRL Field Day June 22-23, some SAREX activities
will take place on shuttle mission STS-78, set to launch June 20.
NASA Payload Commander Susan Helms, KC7NHZ, Mission Specialist
Charles Brady, N4BQW, and Payload Specialist Robert Thirsk, VA3CSA,
hope to find free time to hand out points from the shuttle to Field
Day ops. The crew will use separate receive and transmit
frequencies:

FM voice downlink (worldwide): 145.55 MHz
FM voice uplink: 144.91, 144.93, 144.95, 144.97 and 144.99 MHz
FM voice uplink (Europe only): 144.70, 144.75 and 144.80 MHz
FM packet downlink: 145.55 MHz
FM packet uplink: 144.49 MHz

All this talk about sat tracking programs is making one fundamental mistake.

They are usually sat prediction programs. None of them actually track the sats.

says:
>
>I've heard that NASA select transmissions from shuttle launches/missions
>are broadcasted via tv-satellites in US. Do anyone know is there such
>transmissions in
>european tv-satellites??

The Canadian Space Agency (CSA) used to retransmit NASA TV over
Olympus before it died. An earth station in Holland retransmitted
that to a European satellite. As far as I know now, there is no
other path from NASA TV to Europe.

BTW, there is a "shortwave" service via amatuer station WA3NAN,
which comes out of the Goddard Space Center in Greenbelt MD. 'NAN
retransmits the Shuttle Air-to-Ground voice communications to
amatuers over several HF frequencies and a local 2 meter frequency.

Listen on: 3860, 7185, 14295, 21395 HF & 147.45 Mhz

This is primarily a amatuer radio-oriented service, although there
are many SWLs that tune in.

Check out their Web site @
http://garc.gsfc.nasa.gov/www/garc-home-page.html

Hello all,
I was wondering if anyone out there knows where I can get some of the
QSL vinyl-like,clear QSL card holders that you can hang on a wall.?
Anyone have any suggestions, locations, phone #'s..

Thanks, J, N1RWY FN54VF

Kraus's book on Antennas, a standard work in almost all college libraries, gives a lot of info on Helix antennas.

Johnson's book on Antennas, McGraw Hill, discusses the subject further and includes matching information (originated, by the way, by Kraus apparently.)

IEEE proceedings in the 1960-1975 period has a lot of references to these antennas.

>The appearance of a helix antenna is enough to make me try it.
>Reminds me of the old NASA ground stations.

Read just about any satellite article in Radio Electronics or Electronics Illustrated in the 60's or 70's and you'll see single, dual, or quad helix antennas for tracking. Since the basic impedance of a helix is about 140 Ohms, two paralleled provide 70 Ohms and four provide 35 Ohms.. both of which can be fairly easily matched to 50 Ohms using coaxial transformers. The VHF handbook has construction info on making these using hardware store square aluminum tubing with appropriate connectors and center conductor diameter.

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October 1994 to add the discussion of non-Usenet mailing lists and streamline most of the history discussion, and to change the moderator information for rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

hi there,
the jvfax7.0 is a fine program for all meteosat users (not only for them).
the author eberhard backeshoff has made a good job, even in the design of
the overlay-maps.
But unfortunatly there are no borders for the different countrys.
Im searching for a overlay map (meteosat format d2 and c03) w i t h the
borders if all european states.
if youve any idea how to add this borders to the existing overlay maps,
please let me know.
thanks in advance
73,
Michael Aschauer

Try WinOrbit. It's a free software package for Microsoft
Windows (3.1 or later), which will compute and display the position of
earth satellites. But there are other free tracking programs as well.

Here are pointers you should find useful:

WinOrbit
http://www.sat-net.com/winorbit/

Walnut Creek

Trying to get WISP and my MFJ 1270C w/ MFJ 9600 board working. Problem is that MSPE does not put the TNC into KISS mode - I must do this manually for each pass. I see in the log that the commands are sent but I think something must be fouling up someplace. Any ideas.

I'm running @ 19.2 terminal and use the TNC-2 setting.

Thanks in advance. This sort of kills the automated aspect!

>independent of the design as long as the
>antenna under test does not incorporate an attenuator or amplifier.
>This is simple geometry.
>
>73, Moritz DL5UH

The geometry isn't quite so simple. What matters with respect to
gain are the solid angle subtended by the main beam, the level of
sidelobes, and the F/B ratio. The helix has symmetric E and H
planes, unlike most yagis, so the solid angle is a regular conic
section instead of a irregular pyramid section. Sidelobes are also
often much lower for the helix (but they can be larger too depending
mainly on the ratio of helix length to diameter). And the F/B of
a helix is almost always very good. Taken together, these factors
can allow the helix to have a greater gain for a given azimuthal
pattern than some yagis.

The major advantage of the helix over the yagi, however, is that
it offers a rather broad *bandwidth* over which its gain characteristics
remain good. High gain yagis are inherently narrowband antennas. The
helix is usable over a considerably wider bandwidth because it is a
travelling wave structure.

The major disadvantages are mechanical. A high gain helix is large
and difficult to support and orient.

Hello Ton,

Well the Kansas City Tracker (or KCT for short) is a PC compatible ISA 8 bit card which allows, with the proper software (from Instantrack, MS-DOS to WiSP, Windows), to track the satellites or whatever flying object if you have the orbital keplerian data for it. I use one to track amateur satellites. There are two versions; KCT and KCT/T. The later adds the 'tuning' feature so you can control Doppler effect same time that you track the satellite (this is very useful for LEOS (low orbit satellites)), because, as they run very fast (about 1.5 hours one complete orbit!), Doppler effect if very high.

Please, if you want more specific info, tell me!

Best regards

73s JOSE - EB5AGV@AMSAT.ORG

From: Scott Macmillan <scott@golfmike>
Message-ID: <3caNKCAUYvxxEwDe@golfmike>
Source record: 22131

Hi all, thanks for your time. I have a Tonna 9 ele crossed yagi for
2 meters, and a 2 way power splitter. Can anyone tell me the best
way to make the phasing lines to give me right hand circular
polarization for AO10/13 etc?

Is it OK to route the cables down the boom of the antenna, or will
this distort the polarization?
The N type plug that connects the coax to the driven element is at the
end of a tube (about 10" long) that attaches to the boom, so it would
seem that the coax is to route along the boom. I have read that this is
not a good idea.

Thanks in advance, and see you on the birds.

Subject: Kansas city satalite tracker???

Ton,

Take a look at http://www.netwide.net/logsat You will find a link to the
KCT.

Hello Ton,

Well the Kansas City Tracker (or KCT for short) is a PC compatible ISA 8 bit card which allows, with the proper software (from Instantrack, MS-DOS to WiSP, Windows), to track the satellites or whatever flying object if you have the orbital keplerian data for it. I use one to track amateur satellites. There are two versions; KCT and KCT/T. The later adds the 'tuning' feature so you can control Doppler effect same time that you track the satellite (this is very useful for LEOS (low orbit satellites)), because, as they run very fast (about 1.5 hours one complete orbit!), Doppler effect if very high.

Please, if you want more specific info, tell me!

Best regards

73s JOSE - EB5AGV@AMSAT.ORG

It is below the horizon at your location. Better luck will be had when a closer bird starts carrying internet feeds.

To all radio amateurs

SB SPACE ARL ARLS007
ARLS007 STS-78 update

The countdown continues for the Thursday, June 20, launch of space shuttle Columbia. Shuttle mission STS-78 will carry the SAREX payload. Three amateurs will be among the crew of seven--two Americans and one Canadian: Susan T. Helms, KC7NHZ, will serve as the payload commander. She was a crew member aboard the shuttle Endeavour during STS-54 in January 1993 and operated SAREX from aboard Discovery during STS-64 in September 1994, Charles E. Brady Jr, N4BQW, is a mission specialist on his first shuttle flight. Canadian Robert Brent Thirsk, VA3CSA, will serve as a payload specialist. He's also on his first shuttle flight.

Remaining crew members include Commander Terence T. Henricks, Pilot Kevin R. Kregel, Mission Specialist Richard M. Linnehan, and Payload Specialist Jean-Jacques Favier. During the mission, the shuttle will carry the Life and Microgravity Spacelab to conduct experiments in the weightless environment.

SAREX--the Shuttle Amateur Radio EXperiment--is sponsored by ARRL, AMSAT and NASA and is supported by the FCC. Amateur Radio has been flying aboard the shuttles since 1983.

Launch time for STS-78 is 10:49 AM (Eastern) from the Kennedy Space Center, Cape Canaveral, Florida. The launch will place the shuttle into Earth orbit at an altitude of 173 statute miles. The mission is planned to run for 16 days and ends July 7.

The SAREX Working Group has chosen 11 schools from around the world to make scheduled contacts with the shuttle during this SAREX mission, so students can ask questions of the astronauts during the contact. The schools selected for a scheduled radio contact during this mission are:

Bethlehem Central Senior High School, Delmar, New York

Eisenhower Middle School, San Antonio, Texas

Heritage Middle School, Colleyville, Texas

Anacortes Middle School, Anacortes, Washington

Valley Heights Junior-Senior High School, Blue Rapids, Kansas

Monroe Elementary School, Santa Barbara, California

Maple Grove Education Centre, Nova Scotia, Canada

Saskatoon Public AreospaCe Education (SPACE), Saskatoon, Saskatchewan, Canada

Toowoomba State High School, Queensland, Australia

Catholic Ladies College, Victoria, Australia

CENG--Nuclear Center of Grenoble, Grenoble, France

During most SAREX missions, crew members also make random contacts with earthbound hams. Over the past several years, ham astronauts have contacted thousands of amateurs around the world and, on many missions, they have even carried 2-meter packet. They make these contacts during their breaks, before and after mealtime, and during their pre-sleep time. Innovative computer software allows the crew to operate the packet gear in an unattended mode, allowing amateurs to make contacts with the robot station when the astronauts are working or sleeping. The call signs to look for on FM voice are KC7NHZ, N4BQW and VA3CSA. The FM packet call sign is W5RRR-1.

The crew uses separate receive and transmit frequencies. Please do not transmit on the shuttle's downlink frequency. The downlink is your receiving frequency. The uplink is your transmitting frequency. The crew will not favor any of the uplink frequencies, so your ability to communicate with SAREX will be the luck of the draw. Transmit only when the shuttle is within range of your station and when the shuttle's station is on the air. Here are the SAREX frequencies:

Worldwide FM Voice Downlink: 145.55 MHz

FM Voice Uplink: 144.91, 144.93, 144.95, 144.97, and 144.99 MHz

Europe-only FM Voice Uplink: 144.70, 144.75, and 144.80 MHz

FM Packet Downlink: 145.55 MHz

FM Packet Uplink: 144.49 MHz

Some SAREX activities will take place on shuttle mission STS-78 during this year's ARRL Field Day, June 22-23. KC7NHZ, N4BQW and VA3CSA hope to find enough free time to hand out points from the shuttle to Field Day ops.

Send reports and QSLs to ARRL EAD, STS-78 QSL, 225 Main St, Newington, CT 06111-1494, USA. Include the following information in your QSL or report: STS-78, date and time in UTC, frequency and mode. If you wish to receive a card, include an SASE using a large, business-sized envelope. ''The Net'' in Anacortes, Washington, has generously volunteered to manage the cards for this mission.

Members of the Goddard Amateur Radio Club in Greenbelt, Maryland, retransmit live shuttle air-to-ground audio over the amateur frequencies from club station WA3NAN. To listen in, tune to 3.86, 7.185, 14.295, 21.395, and 28.65 MHz and in the Maryland/DC area on VHF at 147.45 MHz.

Listen to W1AW for SAREX information and Keplerian element updates as they become available. For more information, check the ARRL SAREX Web Page, http://www.arrl.org/sarex or call the ARRL Educational Activities Department, 860-594-0301.

1168. NORAD Two-Line Orbital Element Sets (TLE826)

Newsgroup: rec.radio.amateur.space
Date: 1996-06-18 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4q7bql$s7o@blackbird.afit.af.mil>
Source record: 22135

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Tom,

I'm the author of LogSat. It's one of the best satellite tracking programs you can find, and it only sells for $50. That's nothing compared to the cost of the ham equipment you're using. Unless you stole that too.

Should anybody come with a key, I will never release a shareware version again. There have been already several illegal copies of the commercial software circulating. If this doesn't stop, it will force me to copy-protect the commercial program as well.

And most importantly, copying/cracking software that is copyrighted is a felony in the United States. This copyright extends worldwide to every nation, including nl.

1172. Q: How do programs control KC traker?

Newsgroup: rec.radio.amateur.space
Date: 1996-06-19 00:00:00 UTC
From: bpaul@qualcomm.com
Message-ID: <bpaul-1906961012560001@wpaul-toy.qualcomm.com>
Source record: 22139
Cross-posted to: rec.radio.amateur.space,rec.radio.homebrew

I am working on building an Az/El rotor and plan to build a microprocessor board to control it. My question is, how do the tracking programs, such as LogSat talk to the Kansas city tracker board. From the few programs I've downloaded and tried, it looks like they only work with the KC Tracker.

I know that the KC tracker is an ISA bus card, so I assume it communicates through an I/O address. I am interested in what is on the KC tracker as far as hardware goes. Is it just a parallel port, micro-based?

What I would really like is a program that outputs the Az/El data out the serial or parallel port. That would make my interface much easier to build than a ISA bus card.

Thanks in advance for any info,
-BP

P.S. If I get alot of detailed info, I'll post a summary. -BP

>far as hardware goes. Is it just a parallel port, micro-based?

It uses an I/O address that is switch selectable on the board. It does not involve serial or parallel ports at all, neither does it use an IRQ.

>What I would really like is a program that outputs the Az/El data out the
>serial or parallel port.

This you would need to write yourself. There are products already made that communicate through the serial port. One good one that I use is the Sat trak IV. For more info, see my web page...

http://www.teleport.com/~n7ryw/asatpage.html

This is a microcontroller board that controls the rotors and the radio. It is based on the 8052 mcu, probably just the thing you were thinking of.

1178. check out my nifty project

Newsgroup: rec.radio.amateur.space
Date: 1996-06-21 00:00:00 UTC
From: rb@cyberhighway.net
Message-ID: <4qe33o$8u6@host-3.cyberhighway.net>
Source record: 22145

I get the biggest kick out of chatting with "space people," have several MIR and one SAREX voice contact, this is almost too fun to be legal! Anyway, I usually go to a nearby hill-top to do my "fishing" and got tired of lugging all the radio stuff, so I built a nifty "ham-shack-in-a-box".. Not terribly unusual, but it was a ball to build. If you have a web browser that does graphics, I invite you to check it out and send me any comments or questions.. You'll find it at:

http://www.cyberhighway.net/~rb/project.html

A note to all of you who frequent this group but don't have a Amateur Radio License, GET ON THE BALL! It's never been easier to get a HAM license, you do NOT need to learn code to use the frequencies that are used by MIR and the Shuttle (SAREX)! A friend of mine, with NO previous radio/electronic knowledge borrowed my study book on Wednesday evening, took his test on Saturday morning and passed with a 98%! You can do it too! Amateur Radio NEEDS new blood, if we don't use these frequencies, we'll loose 'em to big corporations and the government, thats a fact! If you have any questions about becomming a "HAM," please ask me! I'll trip over my big feet to get you the information you seek! The first time you call for an astronaut, beit on the MIR or the Shuttle, and a voice comes back to you saying your call sign and a friendly greeting, it will all be worth it! Trust me, it's litterally the most fun you can have with your clothes on.. hehe

Take Care and 73's

John KB7VZL

>IZ3ALU WALTER from CORTINA D'AMPEZZO (BL) ITALY
>narda@sunrise.it

1. get a book about amateur satellites and read about orbits, tracking etc.
e.g.: the satellite experimenter's handbook (ARRL)

2. make sure you can work DUPLEX (transmit on 2m, receive on 70cm)

3. setup some reasonable antennes for these bands. preferably crossed
yagis with circular polarisation, but normal yagis will do for some
experimentation.
I would say a minimum of 5el transmit, 15el receive.
When your cables are long, consider a pre-amp mounted near the antenna.

4. mount the yagis to be movable in both azimuth and elevation.

5. get some software that implements the PACSAT protocols. e.g. look
at ftp.amsat.org
Wellknown programs are: PB/PG, NET, Wisp.

6. when you are lazy: implement automatic tracking of the satellite by
letting the computer control the rotators via some interface or using
a standalone tracking box.

It is a lot of work, but it is fun. When you are only in it for the
end-result (downloading files), you should really consider if it is
worth the expense and the effort. But when your hobby is to study
electronics, computers and software you will have many fun hours ahead.

Rob

Heard a carrier keying up on 145.550 this afternoon. Listened a
few minutes and heard KC7NHZ Susan work a WA3? and then I called
her one time and she came right back then my wife N4TAE called her
one time and worked her. Very easy contact this time. Hope everyone
has as good of luck as we did.
John W5HUQ

>Europe? In particular those frome Goddard Space Flight Center.
>What do I need to listen?
>
>/Martin

You will need a decent S/W receiver with a BFO, since the WA3NAN
transmissions are SSB. Listen on the following freqs:

3860, 7185, 14295 & 21395 Khz.

WA3NAN has a WEB site at:
http://garc.gsfc.nasa.gov/www/garc-home-page.html

1203. Re: Can't compile SatTrack

Newsgroup: rec.radio.amateur.space
Date: 1996-06-24 00:00:00 UTC
From: Manfred Bester <manfred>
Message-ID: <4qmjop$2gu@agate.berkeley.edu>
Source record: 22071

> Has anyone out there compiled SatTrack on a Linux system. I can't seem to
> get it work here. Were can I get the binary?

SatTrack is known to work very well on Linux systems. The only problems typically encountered at compile time are related to the user's environment definitions. If the include path and the library path for the X11 modules are not defined right, then the compilation and the linking will not work. These problems are resolved by defining the appropriate paths either in the cshrc file or in the Makefile for SatTrack.

Please email the error messages to bester@primenet.com and we'll work it out.

The SatTrack web page at

http://www.primenet.com/~bester/sattrack.html

has just been updated and contains patches for Version 3.1 and new screen examples for V4.0.

-Manfred

1204. HELP: EMOTO AZ/EL parts support?

Newsgroup: rec.radio.amateur.space
Date: 1996-06-24 00:00:00 UTC
From: <>
Message-ID: <1996Jun24.192738.437@nosc.mil>
Source record: 22072

I have two EMOTO AZ/EL antenna rotors, one of which is my mobile system.
I would like to get an address of where I can order a small part (the plastic
cover on the elevation connector]. I would also like to get a better technical
manual as mine arrived with zerox copies that did not include any repair part
list or alignment proceedures.

Any help would be appreciated. 73, John AA6QN

1205. Q: Is there a LINUX driver for the KCT/T card ?

Newsgroup: rec.radio.amateur.space
Date: 1996-06-24 00:00:00 UTC
From: <>
Message-ID: <1996Jun24.193321.590@nosc.mil>
Source record: 22073

I think the Subject line states the full question. I am very curious on this issue as I would be nice to work with LINUX and my satellite suite. I guess that I am asking for a WISP version for LINUX OS.

73, John AA6QN

> Has anybody heard anything?

Oh yeah, they've been on the air a lot. I've heard both Susan Helms
and Chuck Brady since last Friday.

The passes over the SF Bay Area have been between approx. 1600Z
and 2200Z. I've mostly heard activity on the 1900Z-2200Z passes
(early afternoon here). That's probably about the time they're
knocking off work for the day.

Evidently the astronauts are getting a partial day off on Tuesday,
so maybe they'll have more time to play radio.

I haven't heard any packet operation yet, nor seen any reports of any.

From: Bob Smith <bsmith@msn.com>
Message-ID: <01bb622c.eca15620$2ca547cc@desktop>
Source record: 22079

Hello, trying to finally get going on UO-22 and KO-23, AO-16 and LU-19. Can anyone give me an idea what the max Dopler affect should be for these birds. I am using FODTRACK to tune the radio and it swings the freqs a lot and I wonder if I'm missing out. I know that PSK requires a big swing, but I though I'd just check anyway.

BTW -- No yagis, using eggbeaters - can I use the KCT SOFTWARE for just radio control. Sure would like to get something windows based.

Thanks
Bob SMith, n3ftu

Source record: 22082

I'm writing from the University of New Hampshire. Rick Linnehan, an astronaut on the space shuttle has indicated that he would like to speak to one of his proffesors from UNH. I am looking for a SAREX capable ground station in the southern New Hampshire or Boston area. If anyone can help me or point me in the right direction it would be very helpful. Thank you

Bill.

p.s. I cut this clip out from the SAREX home page indicating what kind of equipment is needed:

A typical SAREX ground station includes a 2-meter FM transceiver and 25-100 watts of output power. A circularly polarized crossed-Yagi antenna capable of being pointed in both azimuth (N-S-E-W) and elevation (degrees above the horizon) is desirable, but successful contacts have even been made with verticals and groundplane antennas. Commercial and public domain computer tracking software is available to assist you in determining when the shuttle will be within range of your station and where to point your antenna. For more information on assembling your own satellite/SAREX station, obtain a copy of the "Satellite Experimenter's Handbook" from ARRL.

1215. HELP! - WISP MSPE problem

Newsgroup: rec.radio.amateur.space
Date: 1996-06-25 00:00:00 UTC
From: debaker@bnr.ca
Message-ID: <4qor5m$6ra@crchh327.rich.bnr.ca>

Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.digital.misc

Greetings,

I just got WISP configured, but I get the error message
"Error - Unknown KISS data type 10" in the upper right hand
corner as data is received. I selected the option to log
KISS data to disk, and it is definately getting data from
the sats (KO-23, KO-25, UO-22), but never "recognises" it.

Can anyone help???? I am using a 486DX4-100/PK-900/FT-736R.
PK-900 firmware is 05.MAR.93. WISP release 9603.

Thanks in advance for any help.

The Houston Area Amsat group, working with the Texas DX Society as K5DX,
made contacts through RS10/12, RS15, AO-10, AO-13 and AO-27 and FO-20,
as well as some of the digitals. Not a peep out of STS-78, tho.

Nothing (much) to worry about. This in an indication of data overrun from
the TNC to the computer. So the bytes got shifted in the packet and the
KISS data type was the wrong byte.

I don't think there is a KCT driver yet, but you can write it.

>I guess that I
>am asking for a WISP version for LINUX OS.

When you are looking for a tracking program, get sattrack. It has
been often mentioned in this group. It comes as source, so you can
quite easily add drivers for tracking hardware.
(I added the driver for the AMSAT-DL interface and a specialized driver
for my own doppler tracking)

http://www.primenet.com/~bester/sattrack.html

1224. Helix Antenna Analysis for Mars Observer

Newsgroup: rec.radio.amateur.space
Date: 1996-06-26 00:00:00 UTC
From: mwcook@cris.com
Message-ID: <4qqgkd$rlk@tribune.concentric.net>
Source record: 22092
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.space

Helix Antenna Analysis

Given the interest in the use of a bay of Helix Antennas for the Mars Observer experiments, I tried modeling an array of 10 foot helix antennas using the NEC based professional AO program. The model was based on the following design:

21 Turn, 12.5 degree pitch
Wire Dia = 0.1875"
Helix Length = 127.5"
Helix Dia = 8.672"

This turned into a formidable task requiring 884 wire elements for the two stack model.

The single helix had a gain of 12.5 dBdc

The optimum stacking distance appeared to be 58 inches and resulted in a 2.9 dB gain. A four bay array of these antennas would provide a total gain of 20.4 dBic. The first and second side lobes were -11 and -12 db at 20 and 35 degrees. Judging by the pattern, I would expect little G/T performance difference between the helix and a dual polarity yagi array of the same boom length. It should also be noted that the helix was modeled with a perfect ground plane.

I have posted details of the analysis and pattern plots on my webpage at:

http://www.webcom.com/af9y

Hello!

Greetings for everybody who lives in this big and various World.
Greetings for all who likes music or radio.
I am writing my message from Odessa.
It's interesting town, intercity near Black Sea
and here i'm making the tiny musical radiostation.
Even a small station begin to live when she has a pulsing heart.
Yeah, it's a transmitter.
Step by step i save up means for the transmitter.
Anyway i need your help.
You can write me a letter:

Valery V. Filin
Visotckogo str. 12, fl.24
Odessa, 270025
Ukraine

I'll glad to read your advices, opinions and simply good words.
Peoples who want help me are interesting for myself.
Maybe you have a records which must be on a radio.
Please, send your ideas.
And at last you can support me by small sum:

Commerzbank AG, Frankfurt/Main acc.no.4008869901USD
in favour of Imexbank, Odessa in favour of
Valery Victorovich Filin acc.no.001139619.44

Or the way trough the american bank:

The Bank Of New York, N.Y. acc.no.890-0054-808 in favour of
Dialogbank in favour of Imexbank acc.no.02000090088 in favour of
Valery Victorovich Filin acc.no.001139619.44

Thank you.
Warmest regards,

I wonder why I'm not hearing anything! I listened during 3 good
passes (70-80 degree passes), and I still hear nothing from them! I
thought I would at least hear their packet robot sending beacons or
making contacts.
I'm using a 2 meter groundplane up 50 feet and a 50 watt mobile rig.
I have had no problems making contacts with past missions, but this
one is wierd!
Where is everybody getting their Keps from? I am getting mine from
NASA, as well as using the SatTrack web page for times, and I have
heard nothing using both of them!
Maybe later on...

Only once, last sunday. I think it was around lunch time (Noon-ish PDT),
I heard Susan ID. I tried returning the call, but apparently she wasn't
listening on the particular uplink I used (144.97). Then the pass was over.
No packet at all; I even tried connecting, just in case it needed a little
proding to make some noise - nothing.

> Lewis KC5PSX

Yes & no. You need a second receiver to work satellites that receive on
2 meters and transmit on another band. For example with a "short-wave"
or 10 meter radio, you can work the RS-10.

To work sats that operate on 2 meters and 440, you need a radio like the
FT-736 which allows you to work those two bands in duplex.

With the FT-290 alone you can work MIR and SAREX on the Shuttle.

With a 2 meter handi-talkie, if you're lucky, you can work MIR and
the Space Shuttle.

With a 2 meter CW/SSB rig and a 10 meter receiver you can work
RS-10 and RS-15. The RS-10 is by far the easiest sat to work. I
live in a condo and using a 2 meter whip and a random wire
on 10 I work RS-10 on CW any time it's above the horizon.

1242. RE: a question about FT736R

Newsgroup: rec.radio.amateur.space
Date: 1996-06-28 00:00:00 UTC
From: Jim.Hansen@stpete.honeywell.COM
Message-ID: <31D41A97@vax-flcgr.stpete.honeywell.com>
Source record: 22018

I also have a FT736R. However, your question is more general than
specific to the FT736R.
I am assuming your question pertains to SSB operation.

The function of the ALC is to prevent overloading the RF section of the
transmitter. When in SSB you can reduce your power output by reducing
the audio drive or the RF drive. When the RF power output is reduced and
the ALC is not activated since the RF output is bellow the threshold of
peak output. Therefore, the ALC meter will not fluctuate.

So how should you adjust the mic gain? The answer is don't. Just leave
it in the position you had it in when you were working SSB with RF output
control set to maximum. Or, just leave it in the position you normally
use when working FM. This assumes you do not move the mike or talk
louder than normal.

I hope this helps.

I think the IC-821 is FAR better suited for satellite work. You do not need power, you need controllability. I use a Yaesu FT736 with 2m/70cms and the 6m module. I should get a 23cm module to cover every eventuality.

Satellite users/supporter are not very keen when you blast their satellite with 100+Watt+10/15db antenna gain. 10-25watts is really all you need (unless you want to do moon bounce too).

I don't know WISP, but when I would see an error like that in a KISS based program I would think about a problem with multi-channel KISS. type 10 (hex) is the type used for data received from the second channel of the TNC. Maybe WISP cannot cope with it, or has to be configured for it.

>>>I don't know WISP, but when I would see an error like that in a KISS
based program I would think about a problem with multi-channel KISS.
type 10 (hex) is the type used for data received from the second channel
of the TNC. Maybe WISP cannot cope with it, or has to be configured
for it.

Good point - I get the same error from my PK900/DSP93 combo.

None anymore. They converted the format and went scrambled. >:

It used to be on S3/17 at ~1.8 MHz. FM2

Rick

1248. Re: Nothing from STS-78 yet... (SAREX)

Newsgroup: rec.radio.amateur.space
Date: 1996-06-28 00:00:00 UTC
From: ACE <aceflock@erinet.com>
Message-ID: <31D47756.2573@erinet.com>
Source record: 22115

Yesterday starting at 13:36 EDT I started hearing Shannon on the MIR station. She was chatting with what appeared to be a school group. The pass lasted 9 minutes and I was able to hear her on most of the pass.

After the MIR station cleared the Eastern horizon I started hearing STS-78. This pass started at 13:45 EDT and lasted 7 minutes. I was able to hear most of the call that they were acknowledging from the shuttle.

I tried to make contact wih both MIR and STS-78, but no joy. I am operating a Kenwood TM-742A, with a Commet tri-band vertical at 40 ft..

Back on 3 June 1996 I did manage to contact Shannon on a pass that took place at 8:10 EDT.. This pass lasted 8 minutes.

I get my keps from this newsgroup and also retrieve them from the Celestial WWW sight.

I will be checking this newsgroup often, just to see how many more of us make contact.

Ace

1249. STS-78 HF coverage

Newsgroup: rec.radio.amateur.space

I used to be able to receive shuttle transmissions from the goddard space center. On this mission I haven't heard anything. Anyone know why??

LA is a big area -- where specifically are you? Drop me a reply in
Email and I'll try to steer you toward a club in your area where you
can get started.

Dylan,

Check out the AMSAT web site at

http://www.amsat.org/amsat

I got a pretty good FAQ off of it that covers Ham satellite operation.
Plus there is other good stuff there as well.

Tim

1252. SAREX Contact!!!

On today's (06/29/96) 12:14 P.M. PDT pass, I contacted VA3CSA, Robert Thiesk! Heard other contacts (one in AZ). They do listen, and they DO answer. Did anyone else get a contact on this pass? Please post.

1253. NORAD Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1996-06-29 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4r418q$j4v@blackbird.afit.af.mil>
Source record: 22022

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system. In addition, element sets (updated daily) and some documentation and software are also available via anonymous ftp from

archive.afit.af.mil (129.92.1.66)

in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
```

(Letters, blanks, periods, plus signs = 0; minus signs = 1)

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

1255. Re: Any STS-78/SAT during FD?

Newsgroup: rec.radio.amateur.space
Date: 1996-06-29 00:00:00 UTC
From: Jim Brown <starman@conterra.com>
Message-ID: <31D5E32B.70B3@conterra.com>
Source record: 22024

This is supposed to be a SAREX flight but I haven't heard a peep out
of them on voice or packet. The last half dozen SAREX flights have
been like this. I don't know what their problem is or perhaps they
are using the 2-meter radios for personal (family) contacts
and school contacts only. I've been pretty dissapointed in the
SAREX program for the past year as I used to be able to work them
regularly; but I haven't been able to in at least a year. I support
the SAREX program and participated in the SAREX antenna test as well
as hosting a SAREX school contact from my planetarium a few years
ago. I just wish the folks would at least turn the robot on if they
don't have time for voice!

There have been several reports in this newsgroup of people working them. I personally have heard Chuck Brady almost daily since Friday the 21st; usually multiple times per day. The packet robot came on for about a day last Tuesday (I caught it on Wednesday morning), then disappeared for a few days, but I heard it again today.

I'm in the SF Bay Area, btw. Perhaps the passes over Jim's location have been at times when the astronauts are asleep or working, because they've been very active on this mission.

MY APOLOGIZE IF THIS MESSAGE IS NOT APPROPRIATE HERE
=====================================================================

From: Karl M Leite, PS7KM <kleite@summer.com.br>
Subject: How To Work AO-27 from Brazil!!!

Dear Fellows:

Since very long time ago I am trying to use AO-27 but, no luck!
FYI, I never heard that satellite, here in Natal, Brazil.

Also, I don't know if anybody operated via AO-27 from southern
hemisphere. I heard rumor: AO-27 works in northern hemisphere only.

What is wrong for us in southern hemisphere??? I looking to hear
any comments about this matter.

I would like to thank in advance for all replys and if possible,
please, E-mail to below address.

Vy best wishes & 73 de PS7KM,

They've been on the air, I've been listening. Heard them on 3.860 and 7.185
SSB. This morning the propagation must have stunk because they came in fairly
lousy.

Subject: How To Work AO-27 from Brazil!!!

Dear Fellows:

Since very long time ago I am trying to use AO-27 but, no luck!
FYI, I never heard that satellite, here in Natal, Brazil.

Also, I don't know if anybody operated via AO-27 from southern
hemisphere. I heard rumor: AO-27 works in northern hemisphere only.

What is wrong for us in southern hemisphere??? I looking to hear
any comments about this matter.

I would like to thank in advance for all replys and if possible,
please, E-mail to below address.

: and school contacts only. I've been pretty dissapointed in the
: SAREX program for the past year as I used to be able to work them
: regularly; but I haven't been able to in at least a year.

They've been on. I worked them with 25 watts and a Rat Shack discone,
also assisted in a scheduled school contact with Monroe Elementary in
Santa Barbara, which went very well. Heard them working a mobile on
another occasion, as well as packet. The northern passes seem to
be more favorable, probably due to the window chosen for the antenna.

Due to the "belly-first" attitude, don't expect to hear them during the
first one-third or so of the pass. They seem to be favoring the 144.95
voice uplink, that's where I worked them and where others I know have
worked them.

Hello Dave. Heard the contact on that pass.
What uplink freq. were you on?
Most contacts seem to be on 144.950 uplink.
Also saw your packet connect. Congrats on STS-78.
See you during the next mission.

1272. A hint for SAREX/Mir contacts

Newsgroup: rec.radio.amateur.space
Date: 1996-07-01 00:00:00 UTC
From: pwinter@best.com
Message-ID: <4r9al3$9b1@shellx.best.com>
Source record: 22041

As the reports of voice contacts with the shuttle come in,
I'm spurred to suggest to anyone who's trying to get a
SAREX contact (or a Mir contact, for that matter), that
you have an audio tape recorder running when you call.

I have both of my voice contacts on tape (Susan Helms on
STS-64, Don Thomas on STS-70), and believe me, they're prized
possessions. (In fact, I keep a dub in my safe deposit box.)

Although it might seem obvious to get the audio feed directly
from the speaker jack of the radio, remember that it will be
muted while you're talking. (And if you jostle the connector
and it goes in too far, it will mute the built-in speaker of
the radio while the astronaut is talking!) So to get both sides
of the conversation, I just use an inexpensive microphone pointed
at the radio's speaker; I'm close enough that it picks up my
voice, too.

So dig into your storage closet, find that cheapo cassette
recorder you haven't used in years, set it up near your 2m radio,
and be sure to put it in record just before you start calling the
shuttle. And good luck!

73,
Patty

1273. Crossed yagi - linear polarization ?

Newsgroup: rec.radio.amateur.space
Date: 1996-07-01 00:00:00 UTC
From: Philip Peake <philip@vogon.rain.com>
Message-ID: <31D8319D.777D@vogon.rain.com>
Source record: 22042
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.antenna

I have been playing with satellite communications on AO-20,
using a rather unsuitable antenna: a GP9.

I have been considering buying a much better setup, with crossed
yagis for 2m and 70cm. However, I don't want to spend *that* much
on something just for satellite work.

So, how much power loss would I get using circular polarization
where horizontal or vertical would normally be used ?
(I tend to think its 3db ..).

Also, is it possible to feed a crossed yagi to produce (switchable)
LHC, RHC, Hoizontal and Vertical polarizations ?

Philip, KC7FWB

>So, how much power loss would I get using circular polarization
>where horizontal or vertical would normally be used ?
>(I tend to think its 3db ..).

Yes. But only when the other station's polarization is perfectly
aligned with the linear polarization you otherwise would have used.

I have used circular polarization in my station for quite some time
and it turns out it works very well. Fading with mobile stations
tends to be less, and this may even be the case with fixed stations
when working DX.

>Also, is it possible to feed a crossed yagi to produce (switchable)
>LHC, RHC, Hoizontal and Vertical polarizations ?

Sure. You will need a couple of relays and the proper feedline (delay
line) arrangements for the different polarizations. Basically you need
to have a switchable 0/ï¿½/ï¿½ lambda delay in one and 0/ï¿½ lambda delay in
the other feedline.
This is no problem on 2m, but on 70cm it starts becoming tricky...

I am looking for an inexpensive, easy to build, crossed yagi (or other circularly polarized)
antenna design which I can use as a satellite mode B downlink antenna,

Any help would be appreciated.

>(I tend to think its 3db ..).

That's correct.

>Also, is it possible to feed a crossed yagi to produce (switchable)
>LHC, RHC, Hoizontal and Vertical polarizations ?

Yes, that can be done. You can do it with coax relays on the tower,
or you can run dual feedlines down to the shack and do it there with
manual (cheaper) switches or with a coax patchboard (cheapest). Of
course the price of the second feedline might exceed the cost of the
high quality coax relays in some cases.

1281. AO-27 report from Boston, Mass.

Newsgroup: rec.radio.amateur.space
Date: 1996-07-02 00:00:00 UTC
From: mts@usa1.COM
Message-ID: <31D951C1.56F@usa1.com>
Source record: 22050

The last information I received for AO-27 was this.

When the satellite enters sunlight area, it waits approx 20 minutes,
then the repeater turns on. It is on for only 18 minutes and turns off.

This is true for both Northern and Southern hemisphere.
I have tried to work this satellite before it developed problems and
could be heard on it in most of the U.S. and Canada.

I have yet to have a qso with enough information for qsl though.
Keep trying, it is there and working.... ..

I have been listening for the DOVE or DO-17 satellite again so I can
receive and decode more telemetry using the program from Joe Kasser (G3ZC=
Z)
called Whats-Up. This is an awesome program for most amateur radio satell=
ites
and especially handy when working multi satellites.

Unfortunately all I have heard from the DO-17 lately is a single burst of=
1200
baud packet data and nothing else, not like its old self anyway. This is =
with
passes which are very good elevation for my location and with omni antenn=
a and
decent receiver.=20

On the single burst of data I get no telemetry nor any information.

I have been able to get a signal to the Oscar 10 satellite for the
past few nights now with a good return signal while using only 25
watts into a circular polarized antenna for two meteres and seventy
centimeteres.=20

Return signal strength has been good and I can hear many stations.
I have yet to complete a qso though as I don't wish to interupt a
qso in progress for my first contact, so I just listen and call CQ
from time to time in a clear spot.=20

From: mts@usa1.COM
Message-ID: <31D95550.6C9C@usa1.com>
Source record: 22053

Having borrowed some nice equipment, FT-736r and FT-900 transceivers,
I have been working the RS-10 & RS-15 satellites rather regular. The
only sad part is the 06:00utc passes, I end up performing antenna and
signal tests only as there are not other stations on during this time
period. Too bad some of our stations in the satellite service do not
operate there stations in robot mode and in c.w.=20

Using omni directional antenna for both the uplink and downlink and
power levels down to one watt on s.s.b. I have worked several stations
on these two satellites with ease.=20

If you have not tried this, and you have a ten meteres transceiver or
receiver, listen for the RS-10 beacon signal, 20 wpm c.w., on 29.358
and pf course that is =B1 doppler shift which is generally around 1.5 kcs=
=20
higher when the satellite is just coming over your horizon.

I'm just getting started in satellite comunications. I have an Icom 2350, an Alinco 150T, a KPC3, A 9612, and a Cushcraft 270B up about 42'. What will I need to try to contact the shuttle and hit some satellite voice or packet repeaters. Also I could use a copy of some tracking software (shareware if possible) that will allow manual Keplerian input, to enter the daily shuttle data. Thanks for reading this.

Jeff,

If you go to http://www.logsat.com I've placed a short tutorial on what
you need to track satellites. There you will also be able to download a
demo of Logsat, the tracking software.

There are also several shareware trackers available. The best resource to
find them is the following ftp site:
ftp.funet.fi in the directory /pub/ham/satellite/tracking
If you're no too familiar with the ftp protocol you may point your www
browser to: (note that the line begins with ftp:// NOT http://...)
ftp://ftp.funet.fi/pub/ham/satellite/tracking

I personally like STSOrbit and PCTrack (file names SOP96xx.ZIP and
PCTRKxx.ZIP). However, if you're willing to spend the $50, Logsat beats
them all by far...!! :-)

73s,
Roberto

Rein, I checked the amazon online book service, and they list it in their catalog, http://www.amazon.com. I've ordered several books from the service, and have been satisfied so far; they sell something like a million different books.

They have been having problems with Dove for quite a while now. I'm not
sure but I think it's software related. They are working on it as far as I
know. I hope they can get her going again or put up another like her.
I forget what they call the signal she's sending is at the moment. Let's keep
our fingers crossed.

Yes! The software is called Micro Orbiter. You can download a full-featured, fully functioning demo from http://www.infocom.net/~pss. Micro Orbiter has 9 different map projections, including orthographic (which looks like DEMOS, complete with the actual star background) and the oblique aspect vertical perspective. This projection shows the Earth from the satellite's point of view, complete with stars, country boundaries, the terminator, and so on. Everyone says that the graphics are very impressive.

Peter,

I looked at the web pages and the SoftWare looks very impressive. But I have one very important question, does it interface with control boxes like the Kansas City Tracker? If it does not, will that be available soon? If it is available with a later release, what is the upgrade path cost projection? I see that the software does compute Doppler and AZ-EL angles, but no mention of interfacing to controls is mentioned

1293. Re: Any STS-78/SAT during FD?

Newsgroup: rec.radio.amateur.space
Date: 1996-07-02 00:00:00 UTC
From: greg@core.rose.hp.com
Message-ID: <Dtxtt3.ECq@icon.rose.hp.com>
Source record: 22062

I was able to make a Packet contact last Sunday just after Noon. It was a low pass, and only visible for a few minutes, but that was all it took.

Voice activity has also picked up considerably, but it seems that they have a hard time hearing us (or picking out one call from the pile up). I have heard a number of back-to-back "QRZ, this is Columbia" calls. I've tried sending my call in between, but no luck. And that's with 50-ish watts into a 8-element beam. FM is not a friendly mode for working pileups.

Good luck,

Greg KO6TH (STS-78 SAREX packet QSO #765)

1294. HF Propagation Forecast Web Site

Newsgroup: rec.radio.amateur.space
Date: 1996-07-02 00:00:00 UTC
From: efk0490@best.com
Message-ID: <31D9ECFA.5A2D@best.com>
Source record: 22063

For those who haven't found it yet, a WWW site which offers HF propagation forecasts can be found at http://www.sel.noaa.gov/index.html

When the homepage comes up, select the gopher server button, select the "Latest Solar-Geophysical Data" folder, and select the "USAF High Frequency Radio Propagation Report" file. There's a section at the end of the file which explains the codes used in the forecast.

There's a lot of interesting stuff at this site, especially through the gopher server. An interesting link is to the North Western Research Institute RF Scintillation forecast...may be useful to the satellite and meteor scatter communities.

Explore and enjoy!

1295. NORAD Two-Line Orbital Element Sets (TLE833)

Newsgroup: rec.radio.amateur.space
Date: 1996-07-03 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4renth$7nn@blackbird.afit.af.mil>
Source record: 21968

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1296. NOAA/METEOR out of order?

Newsgroup: rec.radio.amateur.space
Date: 1996-07-03 00:00:00 UTC
From: ag381@FreeNet.Carleton.CA
Message-ID: <4rekln$o5i@freenet-news.carleton.ca>
Source record: 21969

In the last few days I can't get any NOAA or METEOR weather sat.Are they
(temporarily) out of order or is my station down?
Just wondering...
Herb.

1297. NORAD Two-Line Orbital Element Set: Space Shuttle (96184.25000000)

Newsgroup: rec.radio.amateur.space
Date: 1996-07-03 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4rchfr$3mg@blackbird.afit.af.mil>
Source record: 22064

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current elements for the current shuttle mission are provided below.

Element sets (also updated daily), shuttle elements, and some documentation and software are also available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

1299. KU band dish size

Newsgroup: rec.radio.amateur.space
Date: 1996-07-03 00:00:00 UTC
From: Rick Harkins <rharkins@qni.com>
Message-ID: <31DA98CB.3BD5@qni.com>
Source record: 22066

This isn't an amateur question, but I couldn't think of a better group to find expertise in...

We need to receive critical business data from Galaxy 4 on KU-band. The vendor wants to install a 1.2 meter dish. I'm sure that a good ole Missouri thunderstorm will kill the signal occasionally. If we installed a larger dish (3 meter?), would the additional gain prevent at least some of the weather fade? Is there a point of diminishing return on dish size?

Thanks in advance for the help...

No problem with noaa 12 & 14 and Meteor 3-5 in the UK.
Also Sich-1 and Okean 1-7 transmit occasionally.

Hello all,
WHat are the 2 meter freqs that are being used to contact the shuttle?
Is there any 440 activity going on as well?

TNX, Jason N1RWY

Hi Jason,

Hope you have better luck than I have had in trying to contact STS-78,
I have tried for them on EVERY pass since launch, no luck. They now
use multiple uplink frequencies and don't favor any particular one,
making a contact just about impossible, I have very mixed feelings
about this new policy. Anyway, here are the freq's you requested and
good luck to you. I should clarify, the crew of STS-78 are very
active on the SAREX, it's just that "I" have not been able to make a
contact or choose the correct uplink freq on any pass thus far.

HAM's on board are:

Susan Helms KC7NHZ
Charles Brady N4BQW
Robert Thirsk VA3CSA

They will all answer a call for W5RRR

Worldwide FM voice downlink is 145.550
FM voice uplinks are 144.91 - 144.93 - 144.95 - 144.97 - 144.99MHz
FM voice uplinks (Europe only) 144.70 - 144.75 - 144.80MHz
Packet Radio Downlink 145.55MHz
Packet Radio Uplink 144.49MHz

Again, good luck and 73's

John Jordan KB7VZL
rb@cyberhighway.net
www.cyberhighway.net/~rb

(Oh how I miss the days of Dr. Norm Thaggard on board the MIR, he was
on constantly, and always used 145.550 simplex)

1304. USA QSL BUREAU UPDATE

Newsgroup: rec.radio.amateur.space
Date: 1996-07-04 00:00:00 UTC
From: aa1mf@aol.com
Message-ID: <4rgmo4$2ag@newsbf02.news.aol.com>
Source record: 21973

******* U.S.A. QSL BUREAU **********
****ANNOUNCES NEW LOWER RATES****
ANNOUNCES EXPANDED DX QSL SERVICE

NOW "QSL VIA USBURO"
A QSL BUREAU FOR DOMESTIC U.S.A. QSL CARDS, ALL 10
DISTRICTS, TERRITORIES AND TRUSTEESHIPS OF THE U.S.A.
NOW A QSL BUREAU FOR ALL YOUR OUTGOING DX CARDS TOO!

DEAR FELLOW HAM,
"THE FINAL COURTESY OF A QSO IS A QSL", BESIDES BEING
ONE OF THE OLDEST QUOTES IN AMATEUR RADIO, IT IS ALSO
OUR TRADITION!

AS POSTAGE COSTS HAVE CLIMBED TO THE CURRENT 20/32 CENTS
FOR CARDS/LETTERS, THE USA QSL BUREAU WAS CREATED BY HAMS
FOR HAMS, TO PROVIDE AN INEXPENSIVE ALTERNATIVE TO THE
HIGH COST OF POSTAGE! ALLOWING ALL OF US THE ABILITY
TO CARRY ON THE TRADITION OF SENDING A QSL CARD FOR ALL
OUR STATESIDE QSO'S.

TO BE SUCCESSFUL, AND FUNCTION PROPERLY, ALL OF US MUST
PARTICIPATE. IT IS OUR SINCERE HOPE AND THE SINCERE HOPE
OF THE HUNDREDS OF YOUR FELLOW HAMS THAT ARE CURRENT USERS,
THAT YOU WILL COME ONBOARD AND FURTHER HELP ALL OF US MAKE
THIS A SUCCESS. THE SAVINGS AND BENEFITS ARE YOUR!!

YOUR PARTICIPATION WILL HELP EVERY U.S. HAM TO ENJOY THE
ABILITY TO CARRY ON THE TRADITION OF BEING ABLE TO TO QSL
EVERY QSO WITH AN INEXPENSIVE ALTERNATIVE, WHILE SAVING
YOU AND EVERYONE OF US BIG BUCKS IN POSTAGE!

AFTER MANY REQUESTS FROM OUR CURRENT USERS WHO WANTED TO BE
ABLE TO "ONE STOP SHOP" AND MANY HAMS THAT ARE NOT ARRL
MEMBERS, WE NOW OFFER YOU THE ABILITY TO SEND ALL YOUR
OUTGOING DX QSL CARDS VIA THE USA QSL BUREAU.

THANK YOU
73'S
BILL-AA1MF-, YOUR FELLOW USERS, & USA QSL BUREAU STAFF

SEND ALL YOUR OUTGOING USA QSL CARDS VIA THE BUREAU
NEW LOW RATE FOR YOUR OUTGOING CARDS;
JUST $0.05 EACH REGUARDLESS OF QUANTITY,
THAT'S JUST $5.00 PER 100 CARDS, A REAL BARGIN!!

PRESORT ALL CARDS BY DISTRICT AND SUFFIX
(IE: W1A, W1B, W4A, W4F, W4G, W4H, W5A, W5C, ETC.)

PLEASE PUT CALLSIGN OF STATION YOU ARE SENDING CARD TO IN
THE ADDRESS SECTION (BACK OF CARD) IN 3/4 INCH LETTERS!!

NO CHARGE FOR CARDS SENT TO YOU BY THE BUREAU - PLEASE KEEP AT LEAST
ONE SASE ON FILE - BUREAU WILL NOTIFY STATIONS THAT HAVE CARDS WAITING
BUT DO NOT HAVE SASE'S ON FILE - ALL CARDS GET DELIVERED!!!

YOU MAY NOW SEND ALL YOUR OUTGOING DX QSL CARDS VIA THE USA QSL BUREAU
RATES FOR YOUR OUTGOING CARDS; $0.05 EACH REGARDLESS OF QUANTITY
YOUR ONLY REQUIREMENT; ALL OUTGOING DX QSL CARDS MUST BE
ALPHABETICALLY SORTED BY CALL-SIGN PREFIX (IE: AM, CE, CO, DL1, DL7,
EA, LH, OA, 3A, 5A, 7JA ETC.)
WE HANDLE CARDS GOING TO ALL IARU BUREAU S & COUNTRIES WITHOUT A
BUREAU BUT HAVE A QSL MANAGER OR OTHER ORGANIZATION AVAILABLE FOR THE
CALL-SIGNS BEING SENT.
A LIST OF COUNTRIES SERVED IS AVAILABLE FOR A SASE, OR BY E-MAIL.
YOU MAY USE -QSL VIA AA1MF- IF YOU PREFER TO HAVE ALL CARDS COME THROUGH
THE USA QSL BUREAU, OTHERWISE YOU WILL RECEIVE YOUR INCOMING DX CARDS
VIA YOUR CALL DISTRICT INCOMING DX QSL BUREAU. BE SURE YOU HAVE SASE S
ON FILE THERE.
A LIST OF INCOMING DX DISTRICT BUREAU S IS AVAILABLE BY SASE OR E-MAIL.

START ENJOYING THE SAVINGS AND BENEFITS TODAY!!
SEND US UP TO -4- #6-3/4(3-5/8 X 6-1/2) SASE's (ONE STAMP EACH)
PLEASE PUT YOUR CALLSIGN IN THE UPPER LEFTHAND CORNER OR SEND US $5.00,
YOUR CORRECT RETURN ADDRESS, & WE SUPPLY 10 SASE's FOR YOU.

SEND YOUR CHECK AND OUTGOING CARDS ALONG WITH YOUR SASE'S TO:
USA QSL BUREAU
P.O. BOX 814
BREWER, ME 04412-0814

DON'T DELAY! DO IT TODAY!
ENJOY THE SAVINGS & BENEFITS TODAY!
THE QSL CARD - THE FINAL COURTESY OF A QSO!!!

THE USA QSL BUREAU IS A NOT FOR PROFIT ORGANIZATION!
OPERATED BY AA1MF & CREW
E-MAIL TO:
AA1MF@AOL.COM
102452.2315@COMPUSERVE.COM

SHOULD YOU HAVE ANY QUESTIONS, PLEASE LET US KNOW!!
WE ARE HERE TO SERVE YOUR DOMESTIC & DX QSL CARD NEEDS!!
>END<

John,
Don't feel bad, I've yet to have any luck myself. Frustrating isn't the
word for it! I hear them CLEAR as a bell but no luck. Many tries, many no
joys. Good luck though!

73!

At 07:01:00UTC on 07:04:96 I picked up the mic to try (for the millionth time) to make a voice contact with STS-78, the only difference with this try was that it was answered! Robert Thirsk (VA3CSA), Payload Specialist, answered my call to W5RRR on an uplink of 144.950MHz and a down of 145.550MHz. I asked how the mission was going and he told me that theyu had just completed muscle strength tests and that the mission was going great, he confirmed my call and QTH and told me that he was logging our QSO. I'm floating about a foot above the ground right now! Just thought I'd share this with someone, before I burst with excitement.. When I get the time, I'm going to make a .wav of my contact with MIR and Columbia (I recorded them) and put them on my web page..

73's all and good luck with your contact attempts, I hope you get'em!

Hello Everybody,
This has nothing to do with Amateur Radio, but it is worth posting.
I saw Space Shuttle Columbia this morning! I woke up at 4:40 AM MDT,
and caught its 5:06 AM MDT pass over Albuquerque, New Mexico!
It was VERY BRIGHT, and it seemed like it was at about 80 degrees,
even though the tracking software said it was at 59 degrees.
If you have never seen the Shuttle, DO IT! It is a great experience
and you will not forget it. I have seen the Shuttle and Mir about 5
or 6 times and they are all like the first time - AWESOME!
Still haven't worked STS-78...I'll keep trying before time runs out.
Happy 4th of July, everybody!
Best of 73,
Brian, N5ZGT

Contrats!! This must be the most active amateur radio mission yet. I am going to have to get a 2 meter rig back in here before the next mission.

On NON-Mir docking missions such as the current STS-78, the shuttle transmits on 145.550 worldwide. The packet uplink (where YOU transmit) is 144.490. There are 5 voice uplinks: 144.91, .93, .95, .97 and .99. 144.95 makes the standard 600 kHz offset for older radios, but the shuttle will listen to any or all... you just have to be "lucky!"

On Mir docking flights, which are VOICE ONLY... the shuttle transmits on 145.840. There are 2 uplinks: 144.45 and 144.47.

Watch for bulletins on packet radio, or you can subscribe to a mailing list at sarex@amsat.org for more current info.

Good luck es 73,
Stan/KD9BE

Radio Meteor Observation Bulletin No. 35 July 1996

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.41 Siedlce Poland 39 04h57(Sun05h57)-02h00(Sat03h00)
66.47 Viesintos Lithuania 12 05h00-22h00
66.50 Sofia Bulgaria 10 24hrs
66.56 Poznan Poland 56 04h57(Sun05h57)-02h00(Sat03h00)
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 06h00-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 o (= East),
elevation 27 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB

Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

June 1996

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

2. ANNOUNCEMENT

The World Radio TV Handbook 1996 (WRTH, 608 pages) celebrates its 50th anniversary. Besides the usual frequency lists and station data, it reviews also equipment. New is the Internet section with URL's of broadcasters and shortwave listening resources.
Edited by Billboard books. Costs $24.95 in the US.

3. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and has gradually been expanded.

Typically it contains: summaries of recent observations, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list,
please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge
from J. Van Wassenhove (current or back-issues).

Just in case anyone reading this is not familiar with how Internet
mailing lists operate, do NOT send your subscription request to
that address. It will go to the hundreds of subscribers on the list,
who will not be amused. :-)

Subscription requests and other administrative messages for all the
AMSAT mailing lists go to listserv@amsat.org. In addition to the SAREX
list, there are ones for AMSAT news bulletins, general discussion of
amateur radio space activities, and Keplerian elements.

Does anyone know of a mod for the Yaesu FT-790RII that allows
finer tuning than 12.5KHz in the FM mode? I am trying to hear AO-27;
12.5KHz tuning doesn't cut it for 436.797Mhz.

That s right! It is a great feeling to have a contact on 560 THz (hi). I saw MIR- space station twice, disappearing in the earth s shaddow. Unfortunately never had a contact on 144MHz.
Good luck to everybody, Roman (DL2SFE)

1314. Kansas City Tracker:- Info required.

Hi Folks!
I am just getting into Satellites and would like to know where I get either a manufactured one or PCB's for a Kansas City Tracker and any relevant data for it.

Are they in a kit form or does one have to make up the thing from scratch....

Many thanks, Robert.

hello everybody, here is BD7IX(Lu Hui-Hua) from P.R.CHINA.
somedays ago, i send a mail at here , said want to know how
to made a modem(tnc) myself, my plan is use TCM3105 or
AM7910(7911) chip to do it, but unfortunate, the chip is
not produce. soi think maybe motorola's MC145442 OR MC145443
can replace it. but mc145442(3) only can use 300 baud
(CCITT V.21 OR BELL 103).
who can tell me the alternative else?
and if i use MC145442(3), who can give the circuit design about it?
please tell me via e-mail bd7ix@amsat.org
thanks

Lu Hui-Hua*bd7ix*

It's interesting to note the VOICE frequency list here.

According to the Southern California digital bandplan,
four of these are packet frequencies:

144.910 Keyboard
144.930 TCP/IP
144.950 Sarex
144.990 9600 Baud and Up...Experimental

(see http://www.ccnet.com/~rwilkins/socal.html)

Note the Sarex PACKET assignment of 144.950. I can vouch for
the fact that 144.910 is used here as digital. Since we are
making all this racket on those frequencies, the astronauts may
be inclined to listen elsewhere for voice contacts. Hmmmmmm.

Up here in the Bay Area, 144.95 has a PacketCluster node on it.
Given that the astronauts can hear a goodly portion of the
country at any given time, it would probably be impossible for
them to find an uplink frequency that's completely clear.

Somehow it all seems to work out, as many, many hams in Northern
California have gotten voice contacts on 144.95 despite the
packet transmissions. (I've had two myself, with a mere 25-30
watts into a 1/4-wave whip on the roof.)

1323. Rare Opportunity for FM, TV, 2-m, and 6-m DXers

On Sunday morning, July 7, around 8:37 a.m. EDT (12:37 UTC), the Space Shuttle Columbia (STS-78) is expected to touch down at Kennedy Space Center. About 25 minutes prior to landing, as it approaches the U.S. Pacific Coast, the orbiter will experience sufficient atmospheric friction to create an ionized wake, a condition persisting for nearly fifteen minutes as the craft streaks like a meteor over central California, Nevada, the "Four Corners" region, Dallas, central Louisiana, and the Gulf Coast of Mississippi.

DXers working VHF frequencies -- TV, FM, 2-meter, and 6-meter ham bands -- who reside within a few hundred miles of the re-entry track will have a rare opportunity to test if the Shuttle-generated plasma trail permits reception of over-the-horizon signals. The circumstances are similar to meteor-scatter reception: Meteors are typically pea-gravel-sized flotsam that ionize narrow columns of the upper atmosphere for a few seconds; in contrast, the near-airliner-sized Shuttle should cut a much larger plasma swath across the sky over an interval of minutes. These temporary plasmas can redirect very-high-frequency radio signals over the horizon, whereas before reception was limited to line-of-site distances from the transmitter. Signals received via Shuttle plasma scattering may persist for a few minutes.

DXers should tune to a known distant station in the general direction of the Shuttle's re-entry track -- that is, if you are south of the track, try for a station to the north, on an unoccupied, interference-free frequency in your area. The following Web site may assist you in finding candidate FM stations, their frequencies, and transmitter power:

http://www.airwaves.com/fmdb.html

- Re-entry Time Line -

If the re-entry goes as planned, the time line will be as follows:

Event Time UTC EDT CDT MDT MST/PDT*

Arrives over West Coast 12:14 8:14 7:14 6:14 5:14

Enters Nevada 12:15 8:15 7:15 6:15 5:15

Overflies "Four Corners" 12:17 8:17 7:17 6:17 5:17

Overflies Dallas, TX 12:21 8:21 7:21 6:21 5:21

Overflies Mississippi Coast 12:24 8:24 7:24 6:24 5:24

KSC Touch down 12:37 8:37 7:37 6:37 5:37

(* Much of Arizona is on Mountain Standard Time [MST].)

More detailed predictions containing look-angles at best visibility
for various locales are available at the end of the document found at:

http://shuttle.nasa.gov/sts-78/orbit/orbiter/sighting/sighting.html

Note that only observers west of Utah will have a decent chance at
visually sighting the Shuttle, due to lessened interference from
sunlight. The sonic boom, however, may be detectable to everyone
in the vicinity of the re-entry track.

- Last-Minute Sources of Information -

Weather conditions at Kennedy may cause last-minute postponement of
the landing. The following Web site provides weather status:

http://www.ksc.nasa.gov/weather/weather.html

Last-minute information about the Shuttle's re-entry/landing status
is available at:

http://shuttle.nasa.gov/

Also, last-minute schedule changes are usually reported on the hourly
national news on CBS Radio affiliate stations, on CNN, and on NASA TV.

I would especially like to hear of any successful (or unsuccessful)
attempts to exploit Shuttle re-entries for DXing purposes. I will
happily summarize them and report the results on these very same
newsgroups. You are welcome to contact me at the e-mail address below.

Good luck!

1325. Re: Crossed yagi - linear polarization ?

Newsgroup: rec.radio.amateur.space
Date: 1996-07-06 00:00:00 UTC
From: Darrel Emerson <74010.2230@compuserve.com>
Message-ID: <31DE2491.6D5B@compuserve.com>
Source record: 21994
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.antenna

Hi Philip,
I do exactly what Gary suggests: I have 2 equal lengths of
cable from the 2 linear feeds of my 2-meter crossed Yagi. The
elements of the crossed Yagi are at 45 degrees to the horizontal.
In the shack, I have one separate quarter-wave lengths of coax,
and a separate half-wave length, either of which can be put into
series with either of the 2 feeders from the antenna.
(1) If I combine the 2 lengths of feeder without any extra length
patched in, I get horizontal linear polarizaton. (By "combine," I mean
the 2 feeders are fed in phase through a suitable coupler.)
(2) If I add a half-wave length into one feeder before combining,
I get vertical linear polarization.
(3) If I combine the 2 feeders with just the extra quarter-wave in
the first of the 2 feeders, I get RHC polarization.
(4) Putting the extra quarter-wave into the second of the 2 feeders,
rather than the first, I get LHC polarization.

Depending on exactly how your antenna is arranged, (1) and (2) may be
swapped, and/or (3) and (4) may be swapped. I chose to arrange the
antenna this way because of the added flexibility, and because adding in
my extra half-wave or quarter-wave of feeder probably adds less loss
than most polarization switching relays. I've found the arrangement
very convenient indeed for both satellite and terrestrial operation.

Good luck,
cheers,
Darrel Emerson (aa7fv@amsat.org)

I am W6KLK. I am using my Yaesu FT-890 in my 1992 Toyota PU V-6 for mobile operation. The noise from the electronic engine control (located on the passenger side panel) is severe and making reception impossible. I am an electrical engineer and I have done mobile noise supression in the past (1950ties) but I am stumped on this one. It appears to be radiated interference, not conducted, but I may be mistaken.

I would appreciate suggestions on how to solve the problem.

Please respond by email. Thanks!

Keith W6KLK <knelson@aimnet.com>

thanks for the response. I had to think about this one for a bit to remember the original post. I still haven't bought a rig yet but I am looking at something a little older than the FT-736. Maybe a 726 if I get lucky and find a cheap one.

I posted this originally about four or five months ago by the way.

Good Morning Everybody,
Who saw or heard the Shuttle while it was re-entering to land? There were about 10 Hams looking for it here in Albuquerque, New Mexico (It is nice to have an "on the air" search party using Amateur Radio so we can all look out for each other). It was supposed to be visible at 22.0 degrees (NNE), at an elevation of 40.4 degrees (Information from NASA).
One Ham was seeing where the Shuttle was on the web. It would update itself every couple minutes.
Well, we all heard the sonic boom (Loud outside Albuquerque, muffled inside the city) when the Shuttle was over Utah. Wonder if NASA's tracking display on the Internet was slow, or delayed.
Anyway, we all heard the sonic boom from STS-78! Sure wanted to see it, but there were some clouds in the way that probably covered it up. We will catch it on the next mission!

Brian Mileshosky, N5ZGT (n5zgt@swcp.com) asked:

> Who saw or heard the Shuttle while it was re-entering to land?....

[Raises hand] I saw it!

Under moderately twilit skies in the San Francisco area, I could follow it nearly from horizon to horizon. Even in twilight it's a cool sight, but it is more dramatic in a *completely* dark sky.

This was my second re-entry sighting. (Saw the last one, too.) But on both occasions I did not hear a sonic boom. (I'm watching from a windy location, and this natural source of white noise could be masking the muffled boom from 45 miles up.)

I'm going to miss seeing these, since there don't appear to be any 39-degree-inclination-orbit missions in the schedule for the next few years....

No luck in Sunnyvale, CA. I live about 3-4 miles from SF Bay and the
morning fog was enough to block it out.
The fog must have muffled the boom also, since I didn't hear it. I did
like the live pictures from the pilot's seat though.

I did not see it, but I heard the booms! This is the third re-entry out of the last five that I have seen from north central Texas. The first (STS-74?) I saw was a 2 AM CST re-entry that was spectacular from my in-town back yard. The fireball was very white with a sparkling quality to it. The best description is the sparkling that one sees around a laser spot. The trail, also bright white, extended horizon to horizon and stayed put, although small gaps did open after a minute or two.

For STS 75, my wife and kids and I got up at 5 AM on a terribly cold (for Texas) morning and saw nothing, not knowing the Shuttle had been waived off for an orbit.

For STS 77, I drove north to Gainesville TX, north of Ft Worth on the OK border. The sun angle was 8 degrees below the horizon and the sky was quite bright and was already blue. The Shuttle fireball appeared as a white spot, no sparkles, and the trail only lasted about 20 degrees behind the fireball. However, we heard the booms with about a five minute delay. The closest approach was about 60 degrees above the horizon.

For STS 78, Ft Worth was scheduled for a zenith crossing, so I drove to a site just south of Ft Worth. We were on a country road away from traffic - to better the chances of hearing the boom. The sun was about 10 degrees up and we did not see a thing - we had the latest NASA predictions, a compass, and WWV, but did not see anything. We then concentrated on the boom, and three minutes after the predicted crossing ... BOOM ... BOOM.

The moral to this is if the sun is up, you won't see a thing, but you can still hear it. If the sky is in twilight, you will see it zip across the sky. If the sky is dark, WHAT A SHOW!

Other experiences?

Just by luck, I had forgotten to turn off my alarm clock Sunday morning. It went off at 5am. I was about to doze again, when I realised that the shuttle would be coming over soon. I tuned into NASA0-selct on TV, and went out on the deck to take a look.

It was actually so bright, I thought that it was a plane coming out of Sacramento International. The smoke trail it left behind showed me that it was Columbia. I did watch it for about a minute until it was out of sight, but I didn't hear a sonic bom. Was it too high over NorCal?

Oh dear. The few miles between Kevin's house and mine (I'm near the
bay--such as it is this far south) must have made the difference.
I had an excellent view from north Sunnyvale.

That pinkish-orange color of the shuttle is unforgettable. The plasma
trail was harder to see this time than in May due to the somewhat
lighter sky, but it was visible, especially in binoculars.

I came back in the house afterwards and almost forgot about the
sonic boom till I heard some folks talking about it on 2 meters.
So I went outside and heard one little thump about 7 minutes
after the shuttle had gone by.

I cannot suggest too strongly that if you ever get a chance to see
a re-entry, do it! You can always make up the lost sleep later.

Redwood City (30 Mi. south of SF) - beautiful!

Brilliant pink-violet "meteor", quite high up in the
northern sky, easily visible even through slight haze.
Seemed as bright or brighter than Jupiter, Venus, etc.
Burned across the sky at exactly the predicted time.
It rolled off into the East where the dawn was starting
to light up the sky. It quickly became a tiny pink dot in
a pink sky - already far, far away. Florida 25 min. later.

No trail visible due to haze. No booms heard - but
birds bolted out of trees around 5 min. after passage.

Well, while I was listening on 146.640, my dad, living in Napa, got his second thrill this year. (The other being 77).

I was able to feed him the numbers Saturday night and 78 was right on time at 5:14 PDT. He reports 78 was not quite as spectacular as 77 as the earlier reentry was in the 3AM range.

Nevertheless, at 80 years old, probably his last chance. :-)

> Who saw or heard the Shuttle while it was re-entering to land?

I was out camping in Grady County, GA (just north of Tallahassee, FL) Sunday morning and we heard the twin sonic booms as clear as day.

We always do down here in south Georgia when the Shuttle lands at KSC.

1342. Question about PSK modems

Newsgroup: rec.radio.amateur.space
Date: 1996-07-08 00:00:00 UTC
From: debaker@bnr.ca
Message-ID: <4rr5vb$4eh@crchh327.rich.bnr.ca>
Source record: 22011
Cross-posted to: rec.radio.amateur.space,rec.radio.digital.misc

Thanks for reading this, I am trying to setup a station capable of receiving 1200 PSK downlinks, but I am unclear about the uplink needed for the PSK sats. Is the uplink identical to the AFSK used in terrestrial systems (i.e. can I use my built-in TNC modem for that) or do you HAVE to use the output from the PSK modem (a PSK-1 in my case). I have not found a clear answer to this in what little information I have been able to find on the subject.

Thanks in advance for any help.

<raises both hands>

I heard it...brother, did I *ever* hear it. I was inside a building in Orlando (sadly, yes, I was working) and the skylight above my head sounded like it was going to rattle enough to break.

It was *GREAT*!!! :-] :-)

I am a TV Enigineer with the University of Kentucky (these opinions are
not theirs) and we have a 6.1 meter uplink/downlink. During very heavy
rain the downlinks vanish. I mean they are gone. The spectrum monitor
shows nothing but system noise. While a larger dish will give you more
"fade" margin, nothing will get signals through a heavy enough rain.
I have even see rain wipe out a 60' dish C band downlink. When you say
"critical", if it is like "life support" critical, you are out of luck.
No distribution, either satellite or land based, is "fail safe". That is
why the military spends fortunes to see that their important messages
get thru. If you system is a "robust" as the DBS tv systems, then
you can expect your data to be there about 99% of the time. And I suspect
that your data rates are much lower than DBS and this should give you
a much beter fade margin than the digital video.
Good luck.

From: Matthew Halsey <matthew.halsey@intelsat.int>
Message-ID: <4rrker$7bs@intelsat2.intelsat.int>
Source record: 22015

Terry,

Any and every satellite link includes a rain margin which is tied to the availability of service. If you want to ensure 99.9% service availability then the rain margin included in the
link analysis needs to be sufficient to counter all but 0.1% of the time, when the heaviest rain is falling. So in your example, the size of the dish may be sufficient to offer you the
availability of service you require. It depends on what availability you have requested or been offered.
Additionally the advantage of a bigger dish is to increase gain but, more importantly, a satellite dish's performance is related to its sensitivity, referred to as G/T (in dB/Kelvin).
What this figure is is the ratio of antenna receive gain to system noise. The system noise is
dominated by the noise of the low noise amp (often quoted as a noise figure). So, it is possible to increase your availability by installing a lower noise amp rather than a bigger dish. Or both and you then get even more improvement.

So, I hope this helps to some extent, but remember your bottom line is the availability of service you require or have been offered. You will never get 100% (except maybe in the Arizona
desert!) and it costs far more to realize small gains in the availability the closer you get to
100%, particularly in Ku-band.

If you want a better explanation please feel free to email me or call me (details below).

Drove for 6 hrs. from LA area to get a good view. Got off the freeway at 5 AM and
found a school grounds area in a residential neighborhood in San Ramon NE of San
Francisco. Was hoping that it didn't get waved off on the first attempt but didn't
know for sure. There it was low on the horizon right on time! Bright and pinkish-red
going across the sky with a plasma trail behind. It started in the western sky where
it was dark enough to see some stars and so was more spectacular at the
beginning of the arc but it could easily be seen until low on the eastern horizon.

This was my first Shuttle re-entry sighting. In all the excitement, I forgot to listen for
a sonic boom and didn't hear anything. Did some sightseeing in No. Calif. and just
got back Mon. evening. I hope to see more Shuttle re-entries, maybe from Baja California.

Jake in Calif.

^^^^^^ ^^^^^

I've seen this phenomenon described as a smoke trail, a condensation trail, and a plasma trail. Having seen it a couple of times myself, what I want to know now is -- exactly what the heck is it?

Of course it also depends on where you are w.r.t. the passing aircraft.

I was on the Edwards AFB shuttle viewing site during a landing in 1989,
and as far as I remember the two booms were quite separate (and *very loud*)
when the shuttle passed over the base before the turn-around and
subsequent landing. Very spectacular!

I am cross-posting and followup this to rec.video.satellite.tvro where
it more properly belongs. Somewhere there you can get the Scrounger's
Guide to TVRO, which will tell you how to set up a dish for $100.
I myself have an old dish setup suitable for this which I have not been
able to give away until recently. And NO, a General Coverage receiver
is not going to help at all, at least for NASA Select.

As a taxpayer who is funding NASA, I was delighted with the payback when they
started their TVRO service. Now that they scramble during the most
interesting times, 4 plex the video (I can't blink that fast), and do
other weird stuff to ruin my reception, I realize that they didn't have
ME in mind afterall. No wonder they don't get funded anymore.

Dear Dan,

I do not know anything about the above.
But I would like to.
Is this something send from space ?
I would like to know what freq's and other data.

Jim, your talking about the SN2 Transponder 5 signal which is the one
that is scrambled. The Transponder 9 signal is in the clear, but
nowadays they are showing a lot of the inside of the Johnson Space
Center instead of the camera located inside the payload bay. Even then
it is still worth it. The Mir linkups have been spectacular.

Hi Dan,

Short of a dish, there's really no way to get it. But if NASA TV was all you wanted, you could certainly scrounge enough basic hardware to rig up a dedicated dish for much less than a couple of thousand dollars.

You would need the dish only, a used spun aluminum or fiberglas would be just fine. You would not even need an equatorial mount or actuator or power supply to move the dish.

You wouldn't even need a polarotor servo or controller once you tuned it up.

You would just need a medium to small C-band dish, some way of fixed-mounting it, an LNB (or LNA) and a compatible receiver even if only with only that one channel works.

If you're a good scrounger you could probably rig up nicely for under $200. A really good scrounger could probably do it for half of that.

Good luck!

1368. Satellite ATV?

Newsgroup: rec.radio.amateur.space

I was wondering if there is any fast scan ATV over amateur radio satellites? It seems like something
neat to do since it would be like running your own satellite network. It would give one an idea of what
the commercial satellite uplinkers do.

Not a general coverage receiver. During shuttle missions there are many NASA audio retransmissions by hams, most notably the Goddard Spaceflight Center's WA3NAN amateur radio club on various shortwave frequencies. But that's only during shuttle missions.

You don't need a couple of thousand dollars for a true satellite receiver -- especially if you're a real ham. If you've got mechanical skills, can crimp a couple of cables together, and if you know how to bargain for old junk equipment (all imporant skills for hams) then you can put together your own satellite dish.

A scrounged satellite dish can be put together for anywhere from almost nothing to a couple of hundred dollars. My particular setup cost $500, and that's only because I wanted a descrambler and a new receiver. Old systems and components can be had for a song or less. There's an excellent document "The Scrounger's Guide to TVRO" which you can get via the Robert Smathers web site http://www.nmia.com/~roberts/ and go to the icon "Gary's information files". Excellent information.

None of the current amateur satellites have the transponder bandwidth
or power necessary to do fast scan ATV. SSTV is possible, however, but
it is discouraged because it is a constant carrier mode and hogs the
shared transponder's power from other users.

You'd need a 22 MHz wide transponder to do the FM TV that the commercial
TV satellites do. Even VSB requires a 6 MHz transponder (and lacking
the FM enhancement factor, would need lots more transponder power to
achieve an equivalent baseband SNR).

Anyone know of a good way of building a home-based, lowcost radio antenna to do amateur SETI?

Thanks!

1375. MIR on UHF

Howdy,

It sounds like the SAFEX experiment has started on MIR! Try
listening on 437.925 MHz.

73,
Joe

Hi rec.radio.amateur readers:
If you are a student, alumnus, employee of the University of Cincinnati (or any other interested party...) and are interested in keeping up on the activities of the University of Cincinnati ARC...

Please send me Email at: aj054@dayton.wright.edu (summer address only) and I will add you to our mailing list!!

We know there are plenty of amateurs affiliated with U.C. who we haven't tracked down yet. We would like to hear from you and keep you informed!!

The golden (no pun intended) trail you may see during the landing pass
is a result of the Orbiter passing through the high thin air at hyper
velocity (12,000 to 16,000 mph), and is definitely a plasma trail. This
is the same effect that caused a communication blackout before we got
TDRSS West in place.

Hi All,

I am having a bit of trouble with KO-23. I receive a strong signal
that is seen by both the radio and TNC but the TNC doesn't see it
as data. The same setup works fine on KO-25 so I think the radio
etc. are fine. Is anyone else having the same problem.

Jim, your talking about the SN2 Transponder 5 signal which is the one
that is scrambled. The Transponder 9 signal is in the clear, but
nowadays they are showing a lot of the inside of the Johnson Space
Center instead of the camera located inside the payload bay. Even then
it is still worth it. The Mir linkups have been spectacular.

I am cross-posting and followup this to rec.video.satellite.tvro where
it more properly belongs. Somewhere there you can get the Scrounger's
Guide to TVRO, which will tell you how to set up a dish for $100.
I myself have an old dish setup suitable for this which I have not been
able to give away until recently. And NO, a General Coverage receiver
is not going to help at all, at least for NASA Select.

As a taxpayer who is funding NASA, I was delighted with the payback when they
started their TVRO service. Now that they scramble during the most
interesting times, 4 plex the video (I can't blink that fast), and do
other weird stuff to ruin my reception, I realize that they didn't have

ME in mind afterall. No wonder they don't get funded anymore.

Not a general coverage receiver. During shuttle missions there are many
NASA audio retransmissions by hams, most notably the Goddard Spaceflight
Center's WA3NAN amateur radio club on various shortwave frequencies. But
that's only during shuttle missions.

You don't need a couple of thousand dollars for a true satellite receiver
-- especially if you're a real ham. If you've got mechanical skills, can
crimp a couple of cables together, and if you know how to bargain for old
junk equipment (all imporant skills for hams) then you can put together
your own satellite dish.

A scrounged satellite dish can be put together for anywhere from almost
nothing to a couple of hundred dollars. My particular setup cost $500,
and that's only because I wanted a descrambler and a new receiver. Old
systems and components can be had for a song or less. There's an
excellent document "The Scrounger's Guide to TVRO" which you can get via
the Robert Smathers web site http://www.nmia.com/~roberts/ and go to the
icon "Gary's information files". Excellent information.

None of the current amateur satellites have the transponder bandwidth
or power necessary to do fast scan ATV. SSTV is possible, however, but
it is discouraged because it is a constant carrier mode and hogs the
shared transponder's power from other users.

You'd need a 22 MHz wide transponder to do the FM TV that the commercial
TV satellites do. Even VSB requires a 6 MHz transponder (and lacking
the FM enhancement factor, would need lots more transponder power to
achieve an equivalent baseband SNR).

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Hello Everyone.
I am new to this list, and this is my first post.
I am interested in trying out FO-20 mode J.
Can anyone recommend a good efficient antenna system, without
the need of elevation control?
Thanks, AL, VE6BPR...sk

ve6bpr@incentre.net

1385. Address of VE6ITV Needed

U.S.A. QSL BUREAU INFORMATION
Providing Domestic QSL Card Service Since Janurary 1996
**NEW LOWER RATES
**NOW DX QSL SERVICE

"QSL VIA USBURO"
A qsl bureau for domestic U.S.A. qsl cards, all 10
districts, territories and trusteeships of the U.S.A.
A qsl bureau for all your outgoing DX cards too!

Dear Fellow Ham,
"The final courtesy of a qso is a qsl", besides being one of
the oldest quotes in amateur radio, it is also our tradition!

As postage costs have climbed to the current 20/32 cents for
cards/letters, the USA QSL BUREAU was created by hams for hams,
to provide an inexpensive alternative to the high cost of
postage, allowing all of us the ability to carry on the
tradition of sending a qsl card for all our stateside qso's.

To be successful, and function properly, all of us must
participate. It is our sincere hope and the sincere hope of
the hundereds of your fellow hams that are current users, that
you will come onboard and further help all of us make this a
success. The savings and benefits are yours!!

Your participation will help every U.S. ham to enjoy the ability
to carry on the tradition of being able to qsl every qso with
an inexpensive alternative, saving you and everyone of us $$$ in
postage.

After many requests from our current users who wanted to be
able to "one stop shop" and hams that are not ARRL members,
we now offer you the ability to send all your outgoing DX qsl
cards via the USA QSL BUREAU.

Thank You,
73's
Bill-AA1MF-, Your fellow users, & the USA QSL BUREAU staff
- -
Send all your outgoing usa qsl cards via the bureau
New low rate for your outgoing cards;
Just $0.05 each reguardless of quantity, A REAL BARGIN!!

Presort all cards by district and suffix
(IE: W1A, W1B, W4A, W4F, W4G, W4H, W5A, W5C, ETC.)

Please put callsign of station you are sending card to in
the address section (back of card) in 3/4 inch letters.

No charge for cards sent to you by the bureau - PLEASE keep at least
one SASE on file - Bureau wil notify stations that have cards waiting
but do not have SASE's on file. - ALL CARDS GET DELIVERED!!

For those of you who would like to "one stop shop" or those who are
not members of the ARRL. You may now send all your out going DX qls
cards via the USA QSL BUREAU.
Rates for outgoing DX qsl cards; $0.05 each regardless of quantity
Your only requirement; ALL outgoing DX qsl cards MUST BE alphabetically
sorted by callsign prefix; (IE: AM, CE, CO, DL1, DL7, EA, LH, OA, 3A,
5A, 7JA ETC.)
We handle cards going to all IARU Bureau's & countries without a IARU
Bureau but have a qsl manager or other organization available for the
callsigns being sent. A list of countries served is available for a
sase or request by e-mail.

You may use "QSL VIA AA1MF" if you prefer to have all cards come through
the USA QSL BUREAU, otherwise you will receive your incoming DX cards
via your call district incoming DX qsl bureau. Be sure you have SASE's
on file there. A list of incoming DX district qsl bureau's is available
by SASE or e-mail request.

Start enjoying the savings and benefits today!!
Send us up to -4- #6-3/4(3-5/8 X 6-1/2) SASE's (one stamp each)
PLEASE put your callign in the upper lefthand corner, or you may send us
$5.00, your correct return address, & we will supply you with 10 SASE's.

Send your check and outgoing cards along with your SASE's to:
USA QSL BUREAU
P.O. BOX 814
BREWER, ME 04412-0814

DON'T DELAY! DO IT TODAY!
The Qsl Card -The Final Courtesy Of A QSO!

The USA QSL BUREAU is a NOT FOR PROFIT ORGANIZATION!

Operated by AA1MF and crew.

1390. Satellite Tracking Program

Newsgroup: rec.radio.amateur.space
Date: 1996-07-16 00:00:00 UTC
From: psgeorge@infinet.com
Message-ID: <psgeorge-1607961616500001@cmh-p141.infinet.com>
Source record: 21869

I have a question... Is there a consensus as to what is the best (feature, price, etc.) satellite tracking program available (PC or Mac)? I've been using WinOrbit (shareware) and it does a reasonable job, but it does lack a few features such as tracking multiple satellites in the same window and the ability to interface with an antenna Az/El controller.

If anyone out there is using one or has an opinion as to which one is best, I would certainly be interested in your opinion.

Thanks!

1391. NORAD Two-Line Orbital Element Sets (TLE837)

Newsgroup: rec.radio.amateur.space
Date: 1996-07-16 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4setbk$so7@blackbird.afit.af.mil>
Source record: 21870

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Brad, there is no fast scan amateur satellite activity that I know of. As to using an amateur satellite for broadcasting... broadcasting is not one of the amateur privileges. We are allowed to communicate, control, relay, etc., but not to broadcast. ARRL does it for training purposes although technically it is illegal.

No 'tisn't.

From 97.111 of the FCC rules:

(b) In addition to one-way transmissions specifically authorized
elsewhere in this Part, an amateur station may transmit the following
types of one-way communications:
...
(5) Transmissions necessary to assisting persons learning, or
improving proficiency in, the international Morse code; and
(6) Transmissions necessary to disseminate information bulletins.

That pretty well covers what W1AW does.

Part 97 even allows someone to get paid for broadcasting the
aforementioned types of items, under certain conditions.

Followups to rec.radio.amateur.policy.

ARRL lawyer to sue member

The following is a copy of a message I received today from
ARRL General Counsel Christopher D. Imlay N3AKD:

To: James S. Kaplan, KG7FU
Copies: Mary Lou Brown, NM7N
Terry Baun
John Poray
Date: July 16, 1996
Re: Your article, SBE Chapter 124 Newsletter, July, 1996
****

Jim, I have just finished reading your article in the July,
1996 Water Cooled Newsletter, page 6. In it, you argue that two of
my clients, the American Radio Relay League, Inc. and the Society
of Broadcast Engineers, Inc. should cooperate in certain government
relations projects, specifically spectrum protection. You note that
I serve as the General Counsel for both organizations. You then
jump from that argument to the following, which I quote:

If Mr. Imlay can't resolve HIS OWN conflicts of interest,
perhaps both ARRL and SBE should be seeking more
effective counsel. No offense Chris, but we have work to
do. We should not only be sending a message to the FCC
and Congress, but to other radio industries.

(emphasis in original)

It is not useful for me to educate you on the subject of your
article to correct the errors in it, and I do not intend to do so.
What I do intend, however, is for you to print a retraction, in
unambiguous terms, in a form acceptable to me, and to furnish to
me, in writing, an assurance that such will be printed in the next
Chapter Newsletter for Chapter 124. Failing that, I am going to sue
you in the District of Columbia for libel.

I have no intention of allowing you to falsely allege that I
have a conflict of interest in representing two of my best clients,
especially in an SBE publication. You are not entitled to damage my
reputation as a lawyer, which you have done in your article, or to
infer (without any basis at all) that I have violated the canons of
ethics governing attorneys, by which I govern my actions.

I will await your response.

Chris Imlay, N3AKD

And here is my reply:

Dear Mr. Imlay:

Thank you for reading my column in the SBE Chapter 124 Newsletter "Water Cooled".

I will not be giving you a retraction for any of my statements published in the July 1996 issue as you have requested. My statements are my personal opinions and views. I do apologize if you feel you have been hurt or damaged by my statements. My intent is to spur thought and action, not to personally attack. If your actions require others to think or act, don't you think they have the right to be informed? I believe my statements to be true and have been given no reason to retract them. My statements, by the way, are my own and don't necessarily reflect the views or opinions of Chapter 124, it's officers or members.

I am a member in good standing of both groups and do many hours of unpaid work for the benefit of both groups and their members. I take personal offense at the threat of lawsuit by their counsel. It is unprofessional and you are certainly coming close to conflict with your fiduciary duty to both groups by proposing to sue a member. Perhaps it is you who owe me, and the Society of Broadcast Engineers and the American Radio Relay League an explanation for your actions and your lack of action in certain critical spectrum protection matters.

After much discussion with SBE and ARRL BOD persons and members I have decided that the best way to deal with this matter is to offer you the chance to refute my statements or rebut, in your own words, in my column for publication in the next issue. In other words, please give yourself the chance to "educate me on the subject of my article to correct the errors in it".

I know you'll also agree that, if you choose to pursue litigation, the proper forum for legal action would be an Oregon court as the column was written and published here.

Sincerely,

James S. Kaplan KG7FU

Hi there,

I use a "J-Pole" which I copied from the ARRL handbook, this antenna exceeds their specs and amazes me daily. I did not need to set up the VSWR after I followed their dimensions explicitly. A pre-amp at the mast is highly reccomended. You will need c0-ax switch if you use a pre-amp for recieve.

Good luck and shout if you want the plans.

Graeme (South Africa)

Ahoy,

I'm not into satellite communications, but I'd like to do a demonstration for my 13-year old nephew who's kinda interested in Amateur Radio.

My QTH is FN54 (MidCoast Maine) and I'd like to know when 10 meters will come alive with downlink activity, say within the next two weeks. I will be grateful to receive a list of times, preferably eveings when I'm home from work.

Pls email me directly as I do not read this list. Mny tnx.

The best is surely out there..! It's LogSat for Windows. Check out the home page at http://www.logsat.com You can download a demo or order the software online.

You can track all the satellites you want in a single windows, and furthermore you can open as many windows as you want at the same time. It uses the KCT to interface with the rotor. There's a kazillion of other features, but the best description can be seen on the home page. There you'll also find fresh keps, separated by satellite type (amateur, weather, visible etc.), and moon keps for EME.

1404. Amateur SETI and/or Radio Astronomy?

Newsgroup: rec.radio.amateur.space
Date: 1996-07-17 00:00:00 UTC
From: marty@trucom.com
Message-ID: <4sjbc5$lom@thepit.trucom.com>
Source record: 21875

Hello, Folks:

Anyone out there doing Amateur Radio Astronomy and/or SETI work?

I suggested this here about 1-2 years ago and was met with a lot of reasons why it won't work. The truth is, there is an entire group of several hundred folks doing it on a world wide basis. For more info, see:

http://wbs.net/sara.html

I personally have not done anything with this as of yet, but it seems to be a natural for Hams!

Any comments or thoughts?

Take Care & 73

Wait... he wants you to apologize and retract what you've said,
but he won't explain the reasons why such a retraction is
neccessary. He just throws out the threat of a libel suit.

Cute. And people wonder why the legal profession has such
a bad reputation...

For the Mac I would suggest OrbiTrack. It's Shareware and available
from all good FTP sites. If you have any trouble finding it let me
know.

Regards,

Sean.

I'll recommend STSORBIT PLUS. Been using it for years. Tracks up to 32 sats
at a time. Another one that seems to be a favorite is tracksat.

RS-15 Beacon (MHz) 29.352
Uplink (MHz) 145.858 - 145.898 USB/CW
1
Downlink (MHz) 29.354 - 29.394
Type Mode A

Notes:

1) Frequenices are shown without Doppler compensation. At start of typical LEO pass,the original signal will be several kHz higher than shown.Refer to specfic satellite operating instructions for complete details.
2) For AO-10 and AO-13 Mode B, transmit in LSB, receive in USB. Also in Mode B, when the transmitted frequency is increased the received frequency will decease (inverting transponder). AO-10 is no longer controllable but the transponder works when the satellite is in sunlight.
3) AO-10 beacon is an unmodulated carrier. DO not transmit to the satellite if the beacon is FMing.
4) AO-13 beacon sends CW at the beginnig of the hour, RTTY at 67 wpm at 15 and 45 minutes past the hour, and 400 bps rest of the time.
5) Presently, FO-20 digital JD mode is not operational.
6) RS-10 Robot via 145.820 MHz uplink and 29.403 downlink.
7) RS-12 Robot via 21.129 MHz uplink and 29.454 MHz downlink
10) JAS-2 Launch scheduled for August 17, 1996. For additional details, refer to JAS-2 article in the Sept/Oct 1995 issue of the AMSAT Journal.

Info from the July/August AMSAT Journal and retyped by N1HID.....

Does anyone know what plans (if any) exist for handling the epoch field
in keplerian elements sets after 1999 ?

For example, the epoch is usually given as something like:
96190.12345 for day 190 of 1996

Will this become
00190.12345 for day 190 of 2000
100190.12345
or something completely different ?

I hav tried WinSat, WinOrbit, WISP, and LogSat Professional for Windows and
find the last the best. IMHO, its so far ahead of the rest in display,
features (multiple satellites on same map, audio warning of satellite
acquisition, etc) that there's absolutely NO CONTEST. I would recommend it
most highly. Check out their web site at www.logsat.com!!

1419. NORAD Two-Line Orbital Element Sets (TLE840)

Newsgroup: rec.radio.amateur.space
Date: 1996-07-19 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4sovd4$ghn@blackbird.afit.af.mil>
Source record: 21890

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1420. Tonna crossed yagi - HELP.

Newsgroup: rec.radio.amateur.space
Date: 1996-07-19 00:00:00 UTC
From: Scott Macmillan <scott@golfmike>
Message-ID: <oSgcuAAUf+7xEwhg@golfmike>
Source record: 21891

Hello all, I have put up a couple of crossed yagis for satellite use.
They are 2X9 ele for 2 meters and a 2X19 ele for 70cms, both are Tonna
antennas.

I have them mounted, horizontally to a 2 meter aluminium cross boom at
a fixed 15' elevation.

Could someone please tell me how to mount these antennas in the
X configuration

If they cant be fitted in the X config, does anyone know where I can get
a fibreglass cross boom, or is it not worth the bother?

Thanks for your time.

There also may be some liability in publicly posting a private legal communication, I don't know. But I do know that spraying the net (8 newsgroups?) with your private gripe is kind of obnoxious and seems intended to intimidate your "opponent". If you wanted opinions from the group(s) about the original complaint, you should have discussed it with us legitimately. You may be a bit casual with your use of mass communication, and you may have also added to your difficulties by posting this way.

1422. RS-10 help

Newsgroup: rec.radio.amateur.space
Date: 1996-07-19 00:00:00 UTC
From: kharker@cs.utexas.edu
Message-ID: <kharker-1907961712350001@slip-47-2.ots.utexas.edu>
Source record: 21893

I've been trying to work RS-10 for a while now from the University of Texas Amateur Radio Club station (W5EHM), and I have a few questions. First, a quick summary of the equipment - A Kenwood HF rig using a Force 12 C-4 beam antenna as the downlink, and an Icom 2m all-mode into a 13 element beam as the uplink. Both beams are mounted on the same tower, the 2m antenna being a few feet above the HF beam, and both are horizontal (not inclined above the horizon, that is.) Both beams perform quite well for terrestrial QSOs.

I can hear RS-10 just fine. Every pass I can hear the CW beacon, and on the reasonably good passes, I can hear other ops in QSO. But when I try to transmit and find my own downlink, I will hear something, but it always seems to have the following happen:

1) If I take the 2m frequency and divide it by the 10m frequency, it always comes out to about 4.996.

2) The signal is unintelligible unless I transmit on the lower sideband.

The latter one may be explained by the fact that you maybe I should transmit on lower sideband? I've never been sure about this. But the first one, coupled with the fact that occasionally I can hear this long after the bird should have been long gone, seems to indicate to me that maybe I'm hearing my own fifth harmonic.

So, 1) do I transmit on LSB or USB? and 2) how do I tell whether or not I'm hearing my own harmonic or a real downlink? I know the antennas are probably not optimal for satellite work, but it's what the club's got :-)

For ALL amateur operators: Visit my web page,
http://www.geocities.com/SiliconValley/8582/ihr, and find several links
to documents that will keep you up to date on the WRC-97 proposal, and
you'll also find a number of documents about Kenwood's 'Bold Step'. For
those of you who have already read about this stuff, be sure to visit
anyway to learn about anything new that has come up.
You can also visiit my web page (in signature) and see what else I have.
While you're visiting, please sign my guestbook so I may see who has
visited my page and from where.
Thank you.

Paul-
It depends on what you are looking to do and hwo your station is set up, i.e. rigs, KCT, Ttrakbox, etc. I personally use LogSat because it has a KCT interface in it (I'm sure most other programs do also) and I'm able to track several analog satellites on one map at a time. I use WinNT and so all my programs are windows based. If you are into the pacsats, I recommend WISP (which can be downloaded from www.amsat.org. You will get recommendations from hams saying that the program that they use is the best in the world but it just comes down to what do you want to do.

Ken, I believe that all the RS (Radio Sport) satellites are
Non-Inverting. If you hear LSB when transmitting USB, something is wrong!
Your question is not clear, but I assume you are listening on USB when
other signals are clear. As for the fifth harmonic, simple listen when you
know that the satellite not in view! Cliff K7RR

From: tkelso@afit.af.mil (TS Kelso)
Subject: NORAD Two-Line Orbital Element Sets (TLE837)

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

1429. A new Helix Antenna design for the Mars Observer Experiment

Newsgroup: rec.radio.amateur.space
Date: 1996-07-20 00:00:00 UTC
From: mwcook@cris.com
Message-ID: <4sptvp$igr@herald.concentric.net>
Source record: 21900
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.space

A new Helix Antenna design for the Mars Observer Experiment

During the last few weeks, I've attempted to optimize a low cost Helix antenna design suitable for detecting the Mars Observer. Here are the characteristics and modeling results:

Reflector Screen: NONE - A single 10.66" loop reflector is used which eliminates the cumbersome reflector screen

Boom: 10 Foot length of 4" dia, thin wall PVC (normally used for tile). Weight is less than 5 Lbs and the cost is $3.50 (at Builder's Square)

Helix: 23 Turns of 1/4" refrigerator copper tubing spaced 5.125" per turn. 55 Feet of tubing required at an approximate cost of $20.

This design has a two step taper for the Helix Dia:

Reflector Loop Dia: 10.66"

First 4 Turns: 10.32"

Next 7 Turns: 8.68"

Last 12 Turns: 8.40"

The reflector is positioned 0.375" ahead of the start point of the first helix turn.

Helix Support: 1/2" PVC tubing used as stubs which are glued in the 4" boom with a spacing of 2.5625"

FeedPoint: 50 Ohm at <1.2 VSWR. No matching network required.

Gain: 15.9 dBci
(approximately 1 to 1.5 dB better than the standard Helix antennas I have modeled)

Pattern: First Side lobes at 36 degrees down 14 dB
Average of all remaining sidelobes <25 dB

Bandwidth: <0.2 dB variability from 432 to 438 Mhz
50 Ohm Match at <1.2 VSWR from 432 to 438 Mhz

Construction accuracy: The Helix diameter, especially the first 4 turns needs to be held to a +/- 0.125" tolerance to keep the gain within 0.5 dB.

Estimated Total Cost: <$30

Two of these antennas provide 18.9 dBci gain which could be enough for detection of the Mars Observer. Four would provide a nice margin at 21.9 dBci.

The pattern/image plots and the AO-PRO input file are available from my webpage. Additional pictures and sketches will be posted as construction proceeds. The webpage adr is: http://www.webcom.com/af9y

I would be happy to model any other helix designs if you email me the dimensions. I'll give any standard reflector screen designs the benefit of a perfect reflector surface. (very time consuming to model a real screen)

Thanks for the reply. I've come to that conclusion myself after trying
several different programs. They're all a little different depending upon
what you're looking for, but for amateur radio, it seems the best!

>Could someone please tell me how to mount these antennas in the
>X configuration

>If they cant be fitted in the X config, does anyone know where I can get
>a fibreglass cross boom, or is it not worth the bother?

When you have no fibreglass cross boom, you don't need to bother mounting
them in X config because it will not improve the circularity.
(OTOH, it might make it easier to switch polarizations, depending on how
you do that)

You also need to feed the coax via the rear of the boom, not via the
cross boom.

Of course, you can also choose not to bother and tolerate some loss
of circularity.

Jim,

Whatever your beef with Chris, I don't think your posting or choice to air your differences with Chris in this particular forum reflects badly on your judgement. It is your reputation which would appear to be tarnished by handling the affair in this manner.

Dave OH2/K8MN

Jim, you wrote and published that Chris Imlay was providing less than
fully effective legal service to two of his clients on account of
conflict of interest. And you have repeated that allegation to the
Usenet world at large.

I believe that a defense of personal opinion is not available to you
in this matter. I believe that you will need sufficient proof for
your repeated allegations of professional malpractice to have Chris
at least sanctioned if not disbarred, or your defense will fail.

> I know you'll also agree that, if you choose to pursue litigation, the
> proper forum for legal action would be an Oregon court as the column was

I wonder how you know that Chris will agree with that? The same way
you know that he is providing ineffective legal services? Oh dear :-(

1434. Mir Contact

Newsgroup: rec.radio.amateur.space
Date: 1996-07-21 00:00:00 UTC
From: bd703@scn.org
Message-ID: <DuvAzs.ACs@scn.org>
Source record: 21905

I finally managed to make a brief contact with Shannon aboard MIR at 17:04 UTC on July 19th.

I was so surprised she answered I couldn't think of much to say except for a greeting and telling her my name and QTH.

XCVR was a 20 year old Heathkit HW-2036A and the ant was a Hustler G6-144-A, mounted on a roof vent pipe. Power output was about 14 watts.

hello, you need to have full duplex i use a 10 meter rec. and a 2 meter trans.the rec. is set on a freq. where i can hear an operator on USB!!! then i transmit a am carrier and tune across the segemit of the ban just below and just above rs-10 input range listen for your tone from the carrier it will go from high pitch to low pitch as you get close to the corrected input freq.[due to doppler shift]then when you are close to the freq. when it clear to trans. [not out of turn or on a already in progress qso]transmit your call and cq while ajusting you transmit freq. to keep your audio clear [ps.switch from am to usb when you get close to the correct freq otherwise you will make a lot of operators upset on the freq below you! try cqs while rec 29.395 usb

Wait a second ...

If a fellow is working for two sides of an issue at the same time there
has to be no proof of conflict. You can not prosecute and defend. There
needs to be no proof.

I can't hire an FCC lawyer to represent me should I be accused of
a Part 97 rule violation. The FCC would see that, without proof, as
a conflict of interest.

Now, is the ARRL seeing their lawyer as being in a conflict of interest?
We've not heard from them. Maybe we should wait for their thoughts.
I hope they comment as I don't want to make my judgement based on
what has been presented here (and with the implications a lack of
comment would have).

Expressing an opinion that someone in a membership organization is
out of line is part of the democracy of the organization ... right?
The legal threats which resulted were sad. I would have defended
myself in a reply. Let's hope he was just too upset to see an
alternative course. If not, he's doing a pretty poopy job (I'm a
member! I'm a member!).

I recommend NOVA for Windows. Now available from AMSAT. A very impressive
program. Supports rotator movement and radio tuning.

Ron, w8gus.

I am only a gonnabe lawyer, so I'm not going to express any legal opinions
regarding this dispute. However, I am going to say that I don't care much
for a scenario where a lawyer threatens litigation against someone who airs
an opinion that the lawyer is acting improperly. The First Amendment was
written precisely to permit ordinary citizens to criticize powerful members of
society without fearing legal retribution. When an attorney seeks to exploit
his stronger position vis'a'vis his ability to litigate, in order to suppress
free speech, this is not good.

In fact, I suspect (this is not a legal opinion, just a guess) that a court would
make short work of any libel case connected with this matter.

As far as the use of the internet goes, I kind of think that the internet
strengthens free speech, by giving those without ordinary media access
a public forum in which to express opinions. Nothing wrong with that, in
my opinion.

>XCVR was a 20 year old Heathkit HW-2036A and the ant was a Hustler G6-144-A,
>mounted on a roof vent pipe. Power output was about 14 watts.
>
>Kerwin, N7JGW

Congrats Kerwin! Nice to see low power stations getting a chance! Now
maybe it's MY turn!

Tom

From: tkelso@afit.af.mil (TS Kelso)
Subject: NORAD Two-Line Orbital Element Sets (TLE837)

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

****

kharker@cs.utexas.edu (Kenneth E. Harker) spat forth this?...:

> So, 1) do I transmit on LSB or USB? and 2) how do I tell whether or
>not I'm hearing my own harmonic or a real downlink? I know the antennas
>are probably not optimal for satellite work, but it's what the club's got
Kenneth,
Transmit in USB As The Satellite Is Not Inverting Your SSB Signal From
USB To LSB As Some satellites do.
Here is a little formula to find your downlink frequency but does not
compensate for Doppler Shift. You'll have to tune around a little to
find your downlink.

F(down) = -116.5 + F(Uplink)

The -116.5 is a translation constant The formula should get you in the
ball park.

By the way you might try lowering your 2 meter xmit power if you are
overloading the 10 meter recv downlink side..
Hope this helps
Maybe i'll catch ya on rs-10 sometime!

In article <31F2CFF4.62BA@apk.net> no8m@apk.net "Steve Wolf" writes:

> If a fellow is working for two sides of an issue at the same time there
> has to be no proof of conflict. You can not prosecute and defend. There
> needs to be no proof.

Not necessarily, it must depend on how many sides there are. The
question is not whether Chris is working for two sides of an issue
but whether it is for two *opposing* sides. Is there an issue for
which he represents two parties where the advancement of one of his
clients' will come from a disadvantage to the other? If so, then
this would be a conflict. What is that issue where this now obtains
for Chris Imlay, Steve? Is the SBE petitioning for 2m? Is the ARRL
going after the TV bands? Do the parties have conflicting positions
on responsibility for EMC?

> Expressing an opinion that someone in a membership organization is
> out of line is part of the democracy of the organization ... right?

The criticism was not about membership behavior but about the
behavior of a professional employee of two membership organizations
in that employee's professional capacity. Chris did not lose his
rights to defend his professional reputation by joining one or more
of the client organizations.

Anyone know of a good way of building a home-based, lowcost radio antenna to
do amateur SETI?

Thanks!

Hi All,

I am having a bit of trouble with KO-23. I receive a strong signal
that is seen by both the radio and TNC but the TNC doesn't see it
as data. The same setup works fine on KO-25 so I think the radio
etc. are fine. Is anyone else having the same problem.

KO-23 is down currently.

Thanks for the info Dave! I hope we can more info as it's available!
What's the status of the 2 meter packet station? I miss it!

Jim, your talking about the SN2 Transponder 5 signal which is the one
that is scrambled. The Transponder 9 signal is in the clear, but
nowadays they are showing a lot of the inside of the Johnson Space
Center instead of the camera located inside the payload bay. Even then
it is still worth it. The Mir linkups have been spectacular.

I am cross-posting and followup this to rec.video.satellite.tvro where
it more properly belongs. Somewhere there you can get the Scrounger's
Guide to TVRO, which will tell you how to set up a dish for $100.
I myself have an old dish setup suitable for this which I have not been
able to give away until recently. And NO, a General Coverage receiver
is not going to help at all, at least for NASA Select.

As a taxpayer who is funding NASA, I was delighted with the payback when they
started their TVRO service. Now that they scramble during the most
interesting times, 4 plex the video (I can't blink that fast), and do
other weird stuff to ruin my reception, I realize that they didn't have

ME in mind afterall. No wonder they don't get funded anymore.

>proper antenna?

Not a general coverage receiver. During shuttle missions there are many
NASA audio retransmissions by hams, most notably the Goddard Spaceflight
Center's WA3NAN amateur radio club on various shortwave frequencies. But
that's only during shuttle missions.

You don't need a couple of thousand dollars for a true satellite receiver
-- especially if you're a real ham. If you've got mechanical skills, can
crimp a couple of cables together, and if you know how to bargain for old
junk equipment (all imporant skills for hams) then you can put together
your own satellite dish.

A scrounged satellite dish can be put together for anywhere from almost
nothing to a couple of hundred dollars. My particular setup cost $500,
and that's only because I wanted a descrambler and a new receiver. Old
systems and components can be had for a song or less. There's an
excellent document "The Scrounger's Guide to TVRO" which you can get via
the Robert Smathers web site http://www.nmia.com/~roberts/ and go to the
icon "Gary's information files". Excellent information.

Subject: Satellite ATV?

In article <4s6vue$baq@oldfart.ecl.wustl.edu> bjl1@cec.wustl.edu (Bradley James Lindseth) writes:
>
>I was wondering if there is any fast scan ATV over amateur radio satellites? It seems like something
>neat to do since it would be like running your own satellite network. It would give one an idea of what
>the commercial satellite uplinkers do.

None of the current amateur satellites have the transponder bandwidth
or power necessary to do fast scan ATV. SSTV is possible, however, but
it is discouraged because it is a constant carrier mode and hogs the
shared transponder's power from other users.

You'd need a 22 MHz wide transponder to do the FM TV that the commercial
TV satellites do. Even VSB requires a 6 MHz transponder (and lacking
the FM enhancement factor, would need lots more transponder power to
achieve an equivalent baseband SNR).

Gary

fellow hams,

I may have been wrong about ALL lawyers,
of course,
Roger ain't really a lawyer, yet.

I have forsale a Yeaseu FT-757GX Cat HF Radio and External Antenna Tuner, Heavy duty power supply in MINT Condition! 1000.00 OBO call 201-440-6566

FT-40/41 440 HT forsale, has Quick Charger (NC-50) and exter 5 watt Battery. $275.00 for the radio $75.00 for the quick charger. $30.00 for the FNB41 5 watt battery.

I would consider a trades for:

A Kenwood TS-940AT in Good working order.
A Yeasu FT1000 in Good working order.

If you guys want to discuss lawyers and the ARRL, fine. Go for it.
But why does this discussion need to be in six different amateur news
groups ? Why not move it to one, maybe .policy, so those of us who
want to read it can, and those of us who don't want to don't have to
delete it six times every day when we download mail ?

Thanks,
Jim KH2D

(Yes, I know I posted this to all the newsgroups.....)

From ARRL Headquarters
Newington, CT July 24, 1996
To all radio amateurs

SB SPACE ARL ARLS008
ARLS008 STS-79 update

If you missed out on a chance to talk to the space shuttle during the recently completed SAREX mission, the next shuttle flight, STS-79, has been rescheduled for September 15 for a nine-day mission. This, the fourth Mir docking mission, will use SAREX configuration ''M,'' which is FM voice, using the Shuttle-Mir 2-meter radio. Three schools--two in the US and one in England--have been confirmed for SAREX QSOs during STS-79. They are: Andover Middle School in Andover, Kansas, Immaculate Conception Elementary School in Celina, Ohio, and The Royal School for Girls in Surrey, England.

Three hams will be aboard space shuttle Atlantis for STS-79. Jay Apt, N5QWL, a mission specialist, has flown on three previous shuttle missions and used Amateur Radio on each flight. Carl Walz, KC5TIE, participated in SAREX from Columbia during STS-65 in July 1994, before earning his ham ticket. Flying his fifth shuttle mission is John Blaha, KC5TZQ, a mission specialist. During STS-79, Blaha will switch places with astronaut Shannon Lucid, and remain with the Mir space station for 5 months. Lucid has been aboard Mir since March 1996. Other STS-79 crew members include Commander William Readdy, Pilot Terrence Wilcutt and Mission Specialist Thomas Akers.

Shuttle mission STS-78 with the shuttle Columbia made history as it broke previous records for mission duration, spending close to 17 days in space before returning to Earth July 7. The flight's SAREX payload also was a huge success. The astronauts made all 11 scheduled SAREX contacts with school groups in the US, Australia, France and Canada, plus many unscheduled SAREX QSOs.

Can one work the various ham sats with the HT-50/51s?

1454. Success and questions...

Newsgroup: rec.radio.amateur.space
Date: 1996-07-25 00:00:00 UTC
From: kharker@cs.utexas.edu
Message-ID: <kharker-2507960132230001@slip-61-12.ots.utexas.edu>
Source record: 21826

I worked my first satellite QSO today! Operating as W5EHM, the
University of Texas Amateur Radio Club station, I worked W2GG in FM19 on
RS-15 around 1748UTC. It was brief, as my 2m xmitter decided to play
tricks on me right after we exchanged rst and signal reports ("Hey! I'm
tuned to the factory default frequency! That's not right..."), but it was
exciting enough!

I'm still having trouble with what I think is my own fifth harmonic,
though. Here's the deal: as I speak into the 2m mic and tune around on
the HF rig, I can hear my own voice fairly loudly, but completely
unintelligbly until I switch to LSB on the 2m rig, at which point it comes
out exactly as I'm saying
it. This would be the undesirable signal. My own downlink, I've discovered,
is a much weaker signal, several kHz up, that kind of sounds like all the
other voices I hear on the satellite and is intelligible while xmitting
USB. The trick, then, was to pick out the downlink in spite of this
relatively (and hopefully just locally :-) strong signal.

Our downlink antenna is a Force-12 C4 10-15-20-30m beam on an
azimuth-only rotor. In this particular case, I was using our 2m vertical
for the uplink, mounted above the beams on the tower, but I've used our 13
element 2m horizontally-polarized beam on the same rotor and heard the
same unfortunate signal. I've tried power levels between 25 and 150W, and
the signal isn't affected a whole lot by changes in power level (making me
think it's a really local thing rather than something that the satellite
is sending back to me.)

So, I'm excited that I made a QSO and I'm going to try again real soon
now, but I'm wondering how I can eliminate the undesireable harmonic (if
that's what it is)? Are there any bandpass filters designed for cutting
off frequencies you're xmiting (rather than just for receiving)? Or are
there any bandpass receiving filters designed for the RS satellite
frequencies?

Hopefully I'll remember to have the tape recorder nearby next time so
I can record what the signal sounds like.

Also, and this is just random, but can RS-10 and RS-15 QSOs count for
satellite VUCC?

7 3 to all...

>are probably not optimal for satellite work, but it's what the club's got
>:-)

Hi Ken,

huuuugh .. something is complete wrong here ... :->)

Tell me, how you can hear the fifth harmonic of your 2m signal on 10m? :-)

Anyhow; if you want to use your 2m yagi and you don't have an elevation rotor, then you can't expect good results via RS-10. It's better to use a simple groundplane for 2m and an output power of 25..100 watt PEP. For receiving I would recommend to have a 10m dipol or a 10m groundplane available too. Especially when the sat is flying overhead then you will have big troubles to copy any signal with a good (!) beam or a good (!) quad.

And last not least: the common phone mode via all RS's is USB on the up- and downlink frequency!

Good luck .. 73 de Waldemar, DK3VN

Well, its a week or so after I posted a question and the lack of
any answer makes me wonder if the fellow should get sued.

I ask my question again ...

Is there any rock solid evidence that the SBE and ARRL are opposed
to any particular issue? By "rock solid" I mean something like a
comment on a rulemaking from the SBE that would be contrary to an
ARRL position on the issue. Or maybe a SBE article that expounds
a position that is obviously anti-amateur radio.

Is the SBE for taking away 40 meters from the amateurs? Perhaps they
want two meters?

Anyone??? Something I can get a copy of ... a magazine article ...
something??? KG7FU???

Subject: NORAD Two-Line Orbital Element Sets (TLE837)

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

SB SPACE ARL ARLS009
ARLS009 Ariane 501 report

A board of inquiry has blamed a software glitch for the June 4 failure of the Ariane 501 launcher after some 40 seconds of flight. The Ariane 502 launcher was scheduled to carry the Phase 3D Amateur Radio satellite aloft this fall. The board's findings could delay that schedule, however, since it's not certain at this point how long it will take to correct the problems and test the revised systems.

The board determined that the rocket's inertial guidance system stopped ''talking'' to the engines, and the thrust nozzles responded by shifting abruptly to an ''extreme position.'' This caused the rocket to veer off at a wild angle. Auto-destruct occurred seconds later.

''The failure of Ariane 501 was caused by the complete loss of guidance and attitude information 37 seconds after start of the main engine ignition sequence (30 seconds after liftoff). This loss of information was due to specification and design errors in the software of the inertial reference system,'' the board concluded. ''The extensive reviews and tests carried out during the Ariane 5 development programme did not include adequate analysis and testing of the inertial reference system or of the complete flight control system, which could have detected the potential failure.''

>What type of orbit are these satalights in??

>1. Geostationary
>2. Geosynchronous
>3. Sunsynchronous

None of the above.

The system is defined with 24 (there are more right now) birds in four
different orbit planes all of which are at a 55 degree inclination. They are
out at about 11,000 miles and thus have about a 12 hour period

1468. Helix Antenna Gain Meas and New Receive Tests

Newsgroup: rec.radio.amateur.space
Date: 1996-07-27 00:00:00 UTC
From: mwcook@cris.com
Message-ID: <4te143$15p@herald.concentric.net>
Source record: 21840

Helix Antenna Gain Meas and New Receive Tests

The test of the 5 foot, no-screen helix prototype at Central States was most positive. In fact, the gain was over 1 dB higher than the model predicted. I will continue using the gain shown by AO for all Mars Observer link caculations.

I found that the GaAs Fet preamp used in my last series of receive test had a poor solder joint in the front end which resulted in a much higher NF than the 0.5 stated. I reran the receive test and also factored in the new receive levels expected from the Mars Observer. The results were very encouraging. A -173 dBm signal level in a 100 deg K system produces an excellent trace using the 16x integration mode of FFTDSP. At this setting, the update rate is once every 8 seconds. A full screen will require only 30 minutes.

Assuming 0.5 dB coax/combiner loss, two 10ft antennas Helix antennas would provide 18 dBic. With the new receive levels, I think this system would provide an excellent chance of detection. In fact, just two 5 ft Helix should be enough for detection.

With the 16x integration mode, Doppler Chirp correction will not be necessary. At that integration mode, the display trace will have a slope showing the Doppler Chirp which should help confirm that it is from the Mars Observer. A 30 minute period will fill the screen and the trace will show a linear slope of aprox 100 Hz.

Full details and pictures of the receive test results and the helix design are available from my webpage at http://www.webcom.com/af9y

From: N6JLH@KJ6FY.#NOCAL.CA.USA.NOAM
To: SPACE@USBBS
Subject: SAFEX REPEATER OPEN
Path: WA1WOK!WB1DSW!W0RLI!K7IQI!KC7KFE!KI7SO!W7OEK!WB7AWL ...

To operate in repeater mode you need:

downlink: 437.950 MHz
uplink: 435.750 MHz with 141.3 Hz CTCSS
ID: RR0DL Repeater

Please also check 437.925 MHz for the beacon (voice recorder).

This next week the Beacon wl be on - so take a listen -

The doppler is [+ & -] 10 kc's - so program your rig
for this -

I have wrked the repeater with 25 watts and 35 elms (sic)

I have NOT been able to work this with a mobile rig
and a 5/8's wave , even on a 75 deg pass -

Rember MIRa moves very fast across the Earth - so make your
contacts as short as you can.

For QSL cards --

Your 10m receiver front end is being overloaded by the 2m uplink. A good
HF low pass filter connected to the 10m receiver will reduce the problem.

James,

I don't see a conflict of interest here. Many lawyers represent competing companies. In fact, you generally seek a lawyer with experience in your industry.

The lawyer can never divulge information about one client to another, so he can't recommend actions to either about the other unless one client asks him to talk to the other. There is no conflict of interest unless one of his clients decides to take legal action against another and asks his advice. At that point, most lawyers tell both of their clients to hire another lawyer to handle that legal action.

Conflict of interest means that he is breaching confidentiality or using knowledge of one client to benefit the other. Just the suspicion of this can cause his clients to leave. Proof gets him disbarred. No wonder he is pissed off.

73,

John

>Can one work the various ham sats with the HT-50/51s?

Not very well. The doppler requires you to be able to tune the
radio to follow it, but the HT has too coarse a tuning step,
minimum 5 kHz, to track the doppler properly. And some of the
sats require SSB receiving capability, so that obviously rules
out the HT. You can work MIR, and sometimes the Shuttle, with
a HT (and perhaps an amplifier).

Gary

>relatively (and hopefully just locally :-) strong signal.

This is *not* a harmonic. A harmonic is a *multiple* of the
transmitting frequency. You're listening at a *fraction* of
the transmitting frequency, so this can't be a harmonic.

What it likely is, is fundamental overload or an IMD mix.
Fundamental overload should show up all over the band,
however, and not show sideband inversion, so the more
likely problem is an IMD mix (that can happen *because*
of fundamental overload, however).

Make sure the VHF and HF antennas are well separated. Make
sure the coaxes aren't tightly bundled together. And add
a lowpass filter to the HF rig. One or more of those steps
should fix the problem (unless it is power supply coupling,
make sure the power supplies for the two radios are separate,
and well decoupled for RF).

1477. Satellite Gateway Questions

Newsgroup: rec.radio.amateur.space
Date: 1996-07-28 00:00:00 UTC
From: dmart@cnj.digex.net
Message-ID: <4tg1a2$g7p@cnj.digex.net>
Source record: 21849

I have a theoretical question that I would like to present to the group. In the future I would like to set up a satellite gateway to a local repeater. I would like to keep things as simple as possible as the equipment would be located at a remote site along with a standard uhf repeater. Antenna control would be accomplished with a Trackbox as I don't have the room to leave a pc at the site. The gateway would operate on a single frequency and won't be frequency agile, as I said before I want this to be simple with little or no maintenance once it is installed. One question that comes up is doppler. I naturally would wish the system to be "locked" on two discreet uplink and downlink frequencies. I know that I would have to establish contact through a satellite to hear my downlink signals and than leave the frequencies at that point. As the bird changes its orbit and the doppler changes would the calibration I've done hold or would my uplink frequency and downlink frequencies drift so that a recalibration would have to be done? I know that computer control can tune both radios, but, I'd like to keep the equipment at the remote site down to a minimum. Naturally I don't want to see my signal and the stations I will be talking to drift all over the band. In this case I will assume that the system would have little if any drift do to temperature etc. I would like to know if doppler would be any factor to consider with regard to drift under unattended operations? I would like to try this on higher frequencies than mode b or j when the Phase-III bird successfully launches and is working. This is a dream now and definitely a project for the far future. At this point I would like to explore the theoretical aspect as of now. Any comments, ideas, or suggestions would be appreciated. Thanks in advance.

Hi Dave,

Could you be a bit more specific? I was unaware that a "repeater" was even aboard the MIR. I know that they carry an ICOM mobile 2m radio for phone and packet, but their having an actual repeater onboard is big news! Could you pass along the output freq and offset for those of us who are obviously MIR news challenged. And here I thought I was keeping on top of space stuff..

73's

John (still trying for a Shannon contact) Jordan KB7VZL

1482. Repeater needed for Reno NV area.

Newsgroup: rec.radio.amateur.space

From: id4eagle1@aol.com
Message-ID: <4thvu9$jtn@newsbf02.news.aol.com>
Source record: 21854

Hello,

This is KE6WBO, and I am requesting help and guidance
on the following issue:

I am involved in an amature rocket flight which will be
taking place next month August the 17th. The rocket
carries a 10w ATV package which will be broadcasting
on 440 Mhz. It also carries a Trimble GPS unit which will have its data
video overlaid on the video.

The launch will take place from Black Rock dry lake bed,
which is roughly 130mi NNE of Reno. The projected altitude will be
somewhere between 90 - 105k'; over
20 mi.

I need to find out who operates repeaters in the area.
How do I contact them to see if they would be willing to
repeat the flight? Are there any ham magazines which might be interested
in a story?

Also, I am working on a helix recieving antenna. I have already built the
helix and the reflector. The helix is copper tubbing, and the reflector
is made from Al wire mesh which is mounted in a screen door frame. I am
about to make the maching section, 75 ohm coax, and little odds and ends
to complete it. I don't have a Bird meter or any way of tunning the
antenna. If any of you in the San Fransicso area would be willing to help
me with the tuning I would appreciate it and mention your name in any
magazine write ups :)

I live in Martinez CA which is about 30 mi NE of San Fransisco CA. I can
be contacted by email on AOL.

I am also looking to by a used 440 recieving antenna (backup for the
flight) and a used bird meter. Oh, the reaso n why I want the helix to
be used is to avoid polarization recieving problems. I will not know the
orientation of the rocket, so having the helix is the logical approach :)
If you can think of another, please let me know :)

Ok, I hope my message gets some useful replies :)

Jonathan Dunbar

Subject: SAFEX REPEATER OPEN
Path: WA1WOK!WB1DSW!W0RLI!K7IQI!KC7KFE!KI7SO!W7OEK!WB7AWL ...

To operate in repeater mode you need:

downlink: 437.950 MHz
uplink: 435.750 MHz with 141.3 Hz CTCSS
ID: RR0DL Repeater

Please also check 437.925 MHz for the beacon (voice recorder).

This next week the Beacon wl be on - so take a listen -

The doppler is [+ & -] 10 kc's - so program your rig
for this -

I have wrked the repeater with 25 watts and 35 elms

I have NOT been able to work this with a mobile rig
and a 5/8's wave , even on a 75 deg pass -

Rember MIRa moves very fast across the Earth - so make your
contacts as short as you can.

For QSL cards --
DF0VR in Germany
If you need any other info

The SAFEX II Station Call RR0DL
==============================
is now working on bord of the Russian Space Station MIR
=======================================================

With the following words Shannon Lucid gave a message on the frequency
437.925 MHz from the MIR space station on the weekend July 13./14., 1996:

"Thanks for the Radio SAFEX, we just turned it on and the best wishes
from the crew of MIR 21. Hope this is of use to you. Many thanks
for the experiment."

Herewith we have reached the first result of our work on the SAFEX project.
Since the construction and the installation on the space station MIR is
finished successfully, we now verify the different modes of the equipment.

The first contact in the QSO-mode was between W5RRR and the MIR station
and the first contact between ground stations via the SAFEX repeater
were IV3WLQ, LY3BH and DF0VR.

Two very important things:
For working via the repeater you must use CTCSS tones. We will publish
the CTCSS tones after checkout.
The Doppler-shift is plus/minus 10 kHz, that means in the begin and the
end of all passes you have a difference of 20 kHz referred to the normal
frequency.
```

+++
+ The Amateur Radio Space Experiment SAFEX II +
+ New Amateur Radio Station RR0DL in Space Station MIR +
+ +
+ by Thomas Kieselbach, DL2MDE +
+++

The international amateur radio community always tries to use also the
manned space flight missions. Thus far, this has occured on several
American and Russian space missions. Years ago the Russians installed
an amateur radio station at the MIR space station. This radio station
operates in the 145 MHz band in voice and packet modes. After the
Russian-German space operation MIR-92 it was proposed to expand the
existing equipment in order to accommodate current communication
technologies. The launch is now planned for spring 1996.

An agreement was made between NPO Energia, Russian radio amateurs,
Deutscher Amateur Radio Club (DARC) and the Ham Radio Group at
the German Aersospace Research Establishment (DLR) in Feburary
1994 to install a new amateur system to the space station MIR. This
system will be mounted to the "Priroda" module and will be comprised
of various components which operate on different radio amateur bands.
On the German side support was given by the Deutsche Agentur fuer
Raumfahrtangelegenheiten (DARA). The costs are shared, whereby the
German side covers the costs for the development and fabrication
(DARA, DARC) and the Russians for the installation at the "Priroda"
module and its operation.

The system is comprised of two main parts with auxiliary equipment:
1. Radio equipment in the 430 MHz amateur band (Duplex Shift 2.2 MHz).
2. Radio equipment in the L/S band (Uplink 1265 MHz/Downlink 2410 MHz).

The first covers primarily the desire for HAM communication and the
second for experiments in future techniques.

History
=======
In the past there has been participation of radio amateurs during several
German space missions:

1985: DP0SL at the first German Spacelab-Mission;
1992: DP1MIR at the Russian-German Mission MIR-92;
1993: DP0SL at the second German Spacelab-Mission;
1994: DP3MIR at the Russian-ESA Misson EUROMIR 94;
1995: DP0MIR at the Russian-ESA Mission EUROMIR 95.

In 1993 first discussions and negotiations with the Russian partners
(NPO Energia) and the Russian radio amateurs took place, which led to
an agreement in March 1994 concerning a new HAM-radio-station on
MIR. In May 1994 DARA promised to participate on financing the
project. In August 1994 an agreement between the partners was signed

for the start of RR0DL in late summer 1995 (postponed to spring 1996).

Project Requirements

The experience of earlier missions showed that astronauts and cosmonauts are very busy and overloaded with work. Therefore the new equipment must offer technical arrangements which permit amateur radio activities without active crew operation. In amateur radio one is concerned with many technical areas. The new equipment will satisfy the desire for both communication and experiments.

The conception on the Russian side had to be fulfilledin detail, but they were very generous. That can be seen from a payload of 30 kilogram, three external antennas and an electrical power of 50 Watts/24 hours with peaks up to 300 Watts for a maximum of 2 hours/day. The technical demands for all parts of the equipment are very high. What does not correspond is not going to be launched. In addition there was a tight time table for the realization of the project.

Concept

The equipment for the RRODL consists of two main parts with several additinal devices.
Radio equipment in the 430 MHz band: Duplex with a 2.2 MHz frequency shift, modified as communication system for the MIR crew.
Radio equipment in the L/S-band: Uplink 23 cm, downlink 12 cm, designed as an experimental system, transponder operation, amateur television (ATV), and future experiments.

There exists already a 2 meter amateur radio station on the MIR space station. It is, however, installed into another module of the station. It is planned to install a 144 MHz-radio, which will be switched by a diplexer, in order to make operation possible from RR0DL on 2 m or crossband.

430-MHz-Equipment

The 430 MHz installation corresponds to a large extend to FM repeater technology. At first it simplified the matter for us that a standard product (ICOM 4020) could be modified. To this device several modifications and additions had to be undertaken. Besides to the additinal features there is installed:

- Diplex filter and switches for 2 meters
- Filter for 70 cm duplex-mode
- Packet Radio TNC for duplex-digipeater
- Digital voice recorder
- Digital voice identification
- changeover of the supply voltage to 28 Volts
- Frequency and operating control system / mode control

The device in its original housing (425mm width x 149mm height x 368mm depth) is built for rack mounting. The handling will be done by

the MIR crew, it is also possible to use remote control from the ground station (Moscow, R3K and Oberpfaffenhofen, DF0VR).

Mode-1: Relay Operation
==========
On-board frequency: 437.950 MHz;
Ground frequency: 435.750 MHz,
accordingly 2.2 MHz frequency shift,
CTCSS tone for operation. 141.3 pl.(n6jlh)

The possibility for FM voice communications covering Europe is achieved. It depends on the users whether these communications can be realized. Radio discipline has first priority. For a special ground station working in undisturbed broadcast mode is possible by using special techniques.

Mode-2: Data Operation (Packet Radio)
==========
On-bord frequency: 437.975 MHz
Ground frequency: 435.775 MHz,
accordingly 2.2 MHz frequency shift,
no CTCSS tone operation.

Previous experience was gathered using packet radio on the MIR space station. The new device operates at 9600 Bd and echoes every data packet. With this concept, a higher data rate than with the former equipment can be achieved on one hand by the data speed, on the other hand the collisions of packets will be reduced to a minimum. There is also a lap-top PC available at the station for mailbox operation.

Mode-3: QSO-Operation of the MIR Crew
==========
On-board frequency: 437.925 MHz;
Ground frequency: 435.725 MHz,
accordingly 2.2 MHz frequency shift,
CTCSS tone for operation.

The cosmonauts can perform regular QSOs and can also carry out special functions with this device. Certainly in QSO operation it is very valueable that at the on-board frequency there are no other signals to be heart (communications discipline!).

In additionion, the cosmonauts have three other possibilities to use RR0DL:

1. In special cases a CTCSS tone can be switched to the transmission of RR0DL and DTMF tones can be used. The crew applies this in case they want to contact specific prepared stations. This is planned for emergency use, contacts with control centers and their families. Ground stations can be equipped accordingly, so that the cosmonaut can dial into a telephone system with DTMF tones in order to reach his XYL or another OM. If this is noticed other hams should not disturb!

2. Furthermore a digital voice recorder will be built into RR0DL.
With that device the cosmonauts have the possibility to
transmit a message worldwide. They record a text on the
digital voice recorder and this text will be transmitted in
regular intervals (duration up to 2 min, then 2 min breake). The
German DLR Ham Radio Group added an identical device to
the already existing 2-m-equipment. The last messages
transmitted from MIR were New Year Wishes (1994),
Greetings to the HAM Fair Friedrichshafen (1994) and at the
EUROMIR 95 Mission.

3. Picture transmission, this part is new in the concept for
RR0DL. A system was developed for transmitting pictures in
digital form. The crew on-board of MIR can take pictures with
a still-video-camera and these can be stored in a lap-top PC.
The basis for the picture transmitting protocol is the AX.25
packet protocol. The picture pixels are transmitted in pseudo-
random kind. With this system recognition of pictures after
only 30 % transmission is possible. Missing pixels will be
mathematically added at the end of transmission. Transmission
time for one picture is 3 minutes. Amateurs can receive the
picture with a normal packet TNC with 9K6 modem and a
special software version from JVFAX (not available yet).

Ground Station for 430 MHz
==========
A normal FM-transceiver with an omni-directional antenna can be used
as ground station. Improved and easier is the operation, if
1. directional antennas
2. computer control for antennas and transceiver
3. CTCSS device
4. scanner operation for the SAFEX frequencies
5. narrow frequency intervals are available.

It has to be considered that the Doppler shift at 430 MHz can be up to 10
kHz. Special information for receiving equipment in future are given in
the mailboxes.

L/S-Band device
==========
This equipment is planned for experiments on amateur radio. The basic
module is working as a transponder with 10 MHz bandwidth, uplink
1265 MHz, downlink 2410 MHz. It is possible to plug different
experimental modules into the basic module. The ATV group at the
University of Bremen will develop and built the ATV equipment and also
the L/S-band basic part.

Experimental modules operate at the intermediate frequency 70 MHz, the
other parameters will be published later. So the possibility for the HAM
community is given, that in the future other communication experiments
at the MIR station can be realized.

Project SAFEX II Fact Sheet

Space AmateurFunk EXperiment
Amateur Radio Equipment for the Russian Space Station MIR

QRV on: 2 meters: RX and TX (Simplex)
70 cm: RX and TX (Duplex)
23 cm: uplink and 12 cm downlink
for voice, data, picture and ATV transmission

Transmit frequencies in the 430 MHz band:

437.925 MHz: direct frequency with the space station MIR,
QSO's with the cosmonauts, picture transmission and
automatically transmitted messages from the MIR crew;

437.950 MHz: repeater (relay operation); voice contacts between
ground stations;

437.975 MHz: data transmission; packet radio direct over greater
distances, mailbox operation with store and forward.

The ground stations transmit on a 2.2 MHz lower frequency. The Doppler
shift can be up to 10 kHz; the correction must be done at the ground
station.

Frequencies for the L/S-band-equipment:

Uplink: 1.265 Ghz
Downlink: 2.410 Ghz
Bandwidth: 10 MHz, linear translation or signals of the space station
(for example amateur television)

SAFEX-II Mission dates: launch spring 1996 as permanent service.

Callsign: RR0DL

Weight: up to 30 kg

Power supply: 50 Watts over a 24 hour period as well as additionally up
to 300 Watts for 2 hours from the on-board supply (28 V).

Operation: Under the control of the cosmonauts; additionally a remote
control is possible from Moscow (R3K) and Oberpfaffenhofen (DF0VR).
SAFEX-II is a project of the German Amateur Radio Club (DARC)
carried out by different groups under project management of the Ham
Radio Group at the German Aerospace Research Establishment (DLR)
Oberpfaffenhofen.

1485. NORAD Two-Line Orbital Element Sets (TLE844)

Newsgroup: rec.radio.amateur.space
Date: 1996-07-30 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4tjvse$rta@blackbird.afit.af.mil>
Source record: 21857

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

I would stay away from NOVA. When it comes time for an update they
will change the name and you must pay full price!
Try LOGSAT PRO. It is a great program and has free updates on the net.
Just want to keep others from making the NOVA mistake like I did!

I am really distressed by this reply. I have tried all of the tracking programs available for DOS since Oscar-7, and find NOVA to be a commendable piece of software.

I can't speak to Logsat Pro, but I can tell you that none of the others I have purchased have *ever* charged me for updates. Not for InstantTrack, not for Nova, not for any of the AMSAT-UK programs. In fact, NOVA users get updates free on the Internet, as do users of most of the other pieces of software out there.

If you don't like the features or operation of NOVA or any other piece of software, that's fine. But to trash a piece of software for a fictional reason, please keep that to yourself!

In <31F993CA.22C@isocor.com>, "John B. Stephensen" <john.stephensen@isocor.com> writes:
>There is no conflict of interest unless
>one of his clients decides to take legal action against another and asks
>his advice. At that point, most lawyers tell both of their clients to
>hire another lawyer to handle that legal action.

I don't know where you get your information, but it is both uninformed and incorrect. The ABA Model Rules of Professional Conduct Sections 2.0-2.2 makes it quite clear that if two clients are adverse in an action, the lawyer cannot represent either, unless one gives the lawyer permission to represent the other.

>Conflict of interest means that he is breaching confidentiality or using
>knowledge of one client to benefit the other.

No, that's not what it means. It means that the lawyer cannot diligently represent one client without failing to diligenly represent the other. (My words, but that's the gist of it.)

>Just the suspicion of this
>can cause his clients to leave. Proof gets him disbarred. No wonder he is
>pissed off.

Wrong again. Disbarment is not always the sanction imposed on a lawyer who violates the rules. Sanctions usually are less severe, such as a public reprimand, or other punitive, non-disbarment stuff.

Message-ID: <4tlscn$or5@tilde.csc.ti.com>
Source record: 21862

Dave, I would like to set up a satellite gateway too. I believe you shouldn't rule out the use of a computer at the site. A 286 should do the job just fine and cost next to nothing (don't need a color monitor,a printer, or a mouse.)

I'm surprised that there haven't been more articles posted on this subject. A gateway would be a good way to generate more interest in the Hamsats. A setup that could be used from a mobile or talkie would be a lot of fun.

Let me know if you get some email on this subject. I could use any info that comes in.

There are many tracking programs out there, and many are commendable but on a fast computer none compare in ease of operation,
flexibility, and the ability to personalize the displays to your own preference, I wouldn't reccomend it for a slow 486 (25 mhz sx) but it is literally
astounding in its flexibility to open different views and different projections. The shareware is too crippled to even use, but the real version is
so amazing I can't imagine you won't be thrilled.

It simply dwarfs other tracking programs... 73 DAVE

To: SAFEX@USBBS
Subject: RR0DL MIR REPEARTER
Path: WA1WOK!WB1DSW!W0RLI!N6IYA!KA6EYH!W6PW!KA6FUB!KJ6FY

Clearance of SAFEX Repeater RR0DL
++++++++++++++++++++++++++++++++
The SAFEX Repeater RR0DL is operating since 12.07.96 onboard the
space station MIR. Worldwide tests have been performed successfully.
From now on the repeater is open to all hams for tests/QSO.
The frequencies are 437.950 MHz downlink / 435.750 MHz
uplink. The repeater works with a CTCSS subtone of 141.3 Hz.

The following recommendations have to be considered:

1. As in any radio contact it is most important to firstly
LISTEN and then TRANSMITTING (discipline).
2. For the purpose of testing of other mods a turn over
is possible at any time. In this case please do not work
via the repeater.
3. After opening the repeater a short "squelch tail" can be
registered, at this time the repeater is open and other
stations without CTCSS subtone can also work via the repeater.
4. The sensibility of the equipment STRONGLY depends on the
attitude of the space station. Due to this reason it can be
that you cannot make a contact.
5. In the repeater mode it is also possible to contact the MIR
crew if one of them takes the mike.
6. A power output of about 25 watts is sufficient. QSO's have been
performed even with hand helds.
7. The Doppler shift has to be considered on both Rx and Tx sites.
Otherwise other stations will be disturbed.
8. Test reports about experiences / contacts are wellcome via packet
or e-mail. Unfortunately we cannot answer on each report directly.

Tips

1. A good method can be introduced here:
Programming of receiver and transmitter frequencies (+CTCSS) or shift
respectively in steps of 2 khz. A contact can be performed by simple
switching over between the channels observing the Doppler shift by
a satellite programme.

CH Rx (MHz) Tx (MHz) or Shift (MHz)
10 437.959 435.741 2.218
11 437.957 435.743 2.214
12 437.955 435.745 2.210

13 437.953 435.747 2.206
14 437.951 435.749 2.202
15 437.949 435.751 2.198
16 437.947 435.753 2.194
17 437.945 435.755 2.190
18 437.943 435.757 2.186
19 437.941 435.759 2.182

2. A pass of MIR space station is possible either northern
or southern with respect to a ground station. Due to the
limitation of the rotors at 0 or 180 grad there is a problem.
We have solved this situation by means of a 4 pole change-over
switch. With two of the switch's contacts the steering cables for
up and down can be interchanged. The other two contacts are used to
interchange the power lines for the potentiometer. The change of
rotor's limit can now be performed by appropriate adjusting in the
satellite programme and switch turn over. With this method good
expierences have been made at DF0VR.

The August 1996 DXpedition to the Midway Atoll National
Wildlife Refuge, KH4 (OC-030), is pleased to announce
that the operation will now include satellite modes.

Joining our team as satellite operator is Pat Guerin NH6UY
of Honolulu who is well experienced in satellite operating from
a number of other Pacific DXpeditions.

The rest of the team, W2UE, UA3AB and WA7LNW join with
me in welcoming Pat to Midway!

QSL route for the Midway operation is Bob Johnson KE7LZ.

I would stay away from NOVA. When it comes time for an update they
will change the name and you must pay full price!
Try LOGSAT PRO. It is a great program and has free updates on the net.
Just want to keep others from making the NOVA mistake like I did!

dcopeland@woodtech.com

If you are using your registered version of NOVA for DOS, and you wish
to change to NOVA for WINDOWS/95?, which are new programs for
what are essentially different operating systems, NOT UPDATES, I
will purchase your DOS version that you are unhappy with if we can
agree on a price.

Anyone using LogSat with Antenna control other than Kansas City Tracker?

I am interested in using the program, but don't know whether The KCT will be my choice of tracking hardware. LogSat supports KCT, but I haven't found any reference to other hardware compatability in the documentation.

Does anyone know of a comprehensive comparison of types
and brands of external box and PC card tracking hardware? If
so,please point me to it. I like the SaTrack IV box, but
also like the Logsat software which works with the Kansas
City Tracker PC card, so anything that would guide me to the best
system would help. There are probably some other programs and
hardware that should be considered, but information is hard to
find. Magazine reviews of equipment aren't much help since they
all seem to be written by the manufacturer's marketing department!

The above post from Russ Renaud that I am replying to implies that I wrote
to stay away from Nova. First off, my portion of the post was not
included in the above message... 2nd, I don't know anything about Nova so
I wouldn't have posted this message. Russ, you should learn how to reply
properly to a post before you start cutting and pasting!

This is not quite true. You will get minor bug fixes for free but when there is new features to NOVA they simply change the name and you will be charged for it again.

I first purchased the product when it was called REAL TRACK and thought it was a good product. I called Mike and and asked about the chance for a Windows version. He told me a new version would be out and I would not want Windows. At Dayton last year I let him talk me into this new version with a new name (so he could charge again) even though I wanted a Windows product. Now he has a Windows version of the same product. I asked him about an upgrade price for current users. He told me none would be offered! When I returned from Dayton I boxed all his stuff up and returned it to him and told him I did not want to support him or his product. In the letter I told him I was not asking for a free lunch, just a reduced price for current users who want to upgrade.

He responded by email and told me there would be no upgrade price. Everyone will have to pay full price.

I then called LOGSAT PRO and asked them how they would handle this problem. They said it would have been a free upgrade!!!

So you see this is not just a flam post, I gave them a chance to make it right and they refused.

So stay away from NOVA !!!!!!!!!!

1505. Russian Space IP Opportunity

Newsgroup: rec.radio.amateur.space
Date: 1996-08-02 00:00:00 UTC
From: glenne@sr.hp.com
Message-ID: <4ttfbn$t8s@canyon.sr.hp.com>
Source record: 21778

Recently Karen, RA3APW, and Leo, UA3CR, were invited by Serge Krikalev, U5MIR, and Serge Samburov, RV3DR, to visit the Russian Space Control Center. U5MIR is currently the deputy chief of Russian space flights and RV3DR is the manager of the Russian space amateur radio program. They were able to have a long talk about future amateur experiments in space, particularly relating to digital radio networking.

Karen brought up the possibility of marrying the existing PACSAT protocols and hardware with amateur TCP/IP networking protocols. He suggested that if this combination were put into place on the oribiter and also at amateur Internet/satellite gateways around the world, perhaps one in each time zone, it could be possible to maintain fulltime IP connectivity with the orbiting MIR.

In addition to offering continuous IP access to MIR from anywhere in the amateur world, such an experiment might be useful for discovering and developing necessary protocols for mobile IP operation; an area where amateurs might have considerable interest and one where we may be able to contribute significantly to the state of the art. Because much, if not all, of the required hardware is already in use, the bulk of the initial task would seem to be in adapting software to allow running IP over PACSAT.

Karen and other Russian amateurs are interested in this project. U5MIR and RV3DR, are supportive of the concept and there would be licensed amateurs aboard the spacecraft. U5MIR is scheduled to be on board the next generation of spacecraft, the ALPHA, which is an international space project. He is interested in applying this idea to ALPHA flights.

A group of Russian amateurs have begun to design low cost satellite ground station hardware for use at the gatways. They are seeking comments on the idea and others to help in making it a reality. Clearly the project will require the help and cooperation of amateurs worldwide.

If you are interested in helping to further develop this project please contact Karen,RA3APW, at:

karen@gw.ra3apw.ampr.org
or sysop@ampr.demos.su
or via KO-23, KO-25 satellites

Also, if you know of someone who might be interested and able to help, please forward this note to them.

This note was written and posted for ra3apw by n6gn.

1506. Aan Adriaan uit Apeldoorn, laat meisje uit Leiderdorp met rust

Newsgroup: rec.radio.amateur.space

"Beste" Adriaan.
We weten meer dan voldoende van je uitspattingen op het net.
Ook weten we dat je via deze groep mail post namens haar.
Ze wil niets meer met je te maken hebben en jij hebt nu ook een
vriendin met kind.
Laat haar met rust !
De volgende maatregel is een klacht en mailbomb bij je provider, eens
kijken hoe lang je je internet aansluiting nog kan misbruiken.
Bestel ook niet namens of voor haar een band van de conventie zoals je
pas hebt gedaan.
Laat haar met rust !!!
We hebben je e-mail naam en provider.
Doe normaal, bemoei je met je eigen zaken en wij laten je verder met
rust.
Zo niet ??
Je bent gewaarschuwd en ligt sneller van internet dan je denkt.

een vriend.

Does anyone know where to find data on the GPS system (such as accuracy, basics on how it works, etc)?

Is there a WWW site somewhere that has this information?

Please respond directly to me. Thanks.

73, Zack W9SZ

1511. NORAD Two-Line Orbital Element Set Format

Newsgroup: rec.radio.amateur.space
Date: 1996-08-05 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4u5cra$sk3@blackbird.afit.af.mil>
Source record: 21784

As a service to the satellite user community, the following description of the NORAD two-line orbital element set format is uploaded to sci.space.news and rec.radio.amateur.space on a monthly basis. The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system. In addition, element sets (updated daily) and some documentation and software are also available via anonymous ftp from

archive.afit.af.mil (129.92.1.66)

in the directory pub/space.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAAAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 0 is a twenty-two-character name (this change is being made to be consistent with the name length in the NORAD SATCAT).

Lines 1 and 2 are the standard Two-Line Orbital Element Set Format identical to that used by NORAD and NASA. The format description is:

```
Line 1
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
```

(Letters, blanks, periods, plus signs = 0; minus signs = 1)

Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

1513. Radiation testing of micros ?

Newsgroup: rec.radio.amateur.space
Date: 1996-08-05 00:00:00 UTC
From: dac@maya.arc.nasa.gov
Message-ID: <DAC.96Aug5091845@maya.arc.nasa.gov>
Source record: 21786

Has anyone done any radiation testing of micro-controllers or micro-processors? I'm interested in both total dose and single event upset numbers. I'm specifically interested in the space environment, so reliability data from ham satellites would be useful too.

I am particularly interested in PICs, 683xx, 68K, 68HC11, 386, 486, and Mips families.

Thanks,
-Dan Christian

Ham-Space Digest Tue, 30 Jul 96 Volume 96 : Issue 229

Today's Topics:
NORAD Two-Line Orbital Element Sets (TLE844)

Send Replies or notes for publication to: <Ham-Space@UCSD.Edu>
Send subscription requests to: <Ham-Space-REQUEST@UCSD.Edu>
Problems you can't solve otherwise to brian@ucsd.edu.

Archives of past issues of the Ham-Space Digest are available
(by FTP only) from ftp.UCSD.Edu in directory "mailarchives/ham-space".

We trust that readers are intelligent enough to realize that all text
herein consists of personal comments and does not represent the official
policies or positions of any party. Your mileage may vary. So there.
------------------------------------------------------------------------

Date: 30 Jul 1996 03:34:38 GMT
From: tkelso@afit.af.mil (TS Kelso)
Subject: NORAD Two-Line Orbital Element Sets (TLE844)

The most current orbital elements from the NORAD two-line element sets are
carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/
```

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

The SAFEX II Station Call RR0DL
==============================
is now working on bord of the Russian Space Station MIR
===

With the following words Shannon Lucid gave a message on the frequency
437.925 MHz from the MIR space station on the weekend July 13./14., 1996:

"Thanks for the Radio SAFEX, we just turned it on and the best wishes
from the crew of MIR 21. Hope this is of use to you. Many thanks
for the experiment."

Herewith we have reached the first result of our work on the SAFEX project.
Since the construction and the installation on the space station MIR is
finished successfully, we now verify the different modes of the equipment.

The first contact in the QSO-mode was between W5RRR and the MIR station
and the first contact between ground stations via the SAFEX repeater
were IV3WLQ, LY3BH and DF0VR.

Two very important things:
For working via the repeater you must use CTCSS tones. We will publish
the CTCSS tones after checkout.
The Doppler-shift is plus/minus 10 kHz, that means in the begin and the
end of all passes you have a difference of 20 kHz referred to the normal
frequency.

++
+ The Amateur Radio Space Experiment SAFEX II +
+ New Amateur Radio Station RR0DL in Space Station MIR +
+ +
+ by Thomas Kieselbach, DL2MDE +

++

The international amateur radio community always tries to use also the manned space flight missions. Thus far, this has occured on several American and Russian space missions. Years ago the Russians installed an amateur radio station at the MIR space station. This radio station operates in the 145 MHz band in voice and packet modes. After the Russian-German space operation MIR-92 it was proposed to expand the existing equipment in order to accommodate current communication technologies. The launch is now planned for spring 1996.

An agreement was made between NPO Energia, Russian radio amateurs, Deutscher Amateur Radio Club (DARC) and the Ham Radio Group at the German Aersospace Research Establishment (DLR) in Feburary 1994 to install a new amateur system to the space station MIR. This system will be mounted to the "Priroda" module and will be comprised of various components which operate on different radio amateur bands. On the German side support was given by the Deutsche Agentur fuer Raumfahrtangelegenheiten (DARA). The costs are shared, whereby the German side covers the costs for the development and fabrication (DARA, DARC) and the Russians for the installation at the "Priroda" module and its operation.

The system is comprised of two main parts with auxiliary equipment:
1. Radio equipment in the 430 MHz amateur band (Duplex Shift 2.2 MHz).
2. Radio equipment in the L/S band (Uplink 1265 MHz/Downlink 2410 MHz).

The first covers primarily the desire for HAM communication and the second for experiments in future techniques.

History
=======
In the past there has been participation of radio amateurs during several German space missions:

1985: DP0SL at the first German Spacelab-Mission;
1992: DP1MIR at the Russian-German Mission MIR-92;
1993: DP0SL at the second German Spacelab-Mission;
1994: DP3MIR at the Russian-ESA Misson EUROMIR 94;
1995: DP0MIR at the Russian-ESA Mission EUROMIR 95.

In 1993 first discussions and negotiations with the Russian partners (NPO Energia) and the Russian radio amateurs took place, which led to an agreement in March 1994 concerning a new HAM-radio-station on MIR. In May 1994 DARA promised to participate on financing the project. In August 1994 an agreement between the partners was signed for the start of RR0DL in late summer 1995 (postponed to spring 1996).

Project Requirements
====================
The experience of earlier missions showed that astronauts and cosmonauts are very busy and overloaded with work. Therefore the new equipment must offer technical arrangements which permit amateur radio

activities without active crew operation. In amateur radio one is concerned with many technical areas. The new equipment will satisfy the desire for both communication and experiments.

The conception on the Russian side had to be fulfilledin detail, but they were very generous. That can be seen from a payload of 30 kilogram, three external antennas and an electrical power of 50 Watts/24 hours with peaks up to 300 Watts for a maximum of 2 hours/day. The technical demands for all parts of the equipment are very high. What does not correspond is not going to be launched. In addition there was a tight time table for the realization of the project.

Concept
=======
The equipment for the RRODL consists of two main parts with several additinal devices.
Radio equipment in the 430 MHz band: Duplex with a 2.2 MHz frequency shift, modified as communication system for the MIR crew.
Radio equipment in the L/S-band: Uplink 23 cm, downlink 12 cm, designed as an experimental system, transponder operation, amateur television (ATV), and future experiments.

There exists already a 2 meter amateur radio station on the MIR space station. It is, however, installed into another module of the station. It is planned to install a 144 MHz-radio, which will be switched by a diplexer, in order to make operation possible from RR0DL on 2 m or crossband.

430-MHz-Equipment
=================
The 430 MHz installation corresponds to a large extend to FM repeater technology. At first it simplified the matter for us that a standard product (ICOM 4020) could be modified. To this device several modifications and additions had to be undertaken. Besides to the additinal features there is installed:

- Diplex filter and switches for 2 meters
- Filter for 70 cm duplex-mode
- Packet Radio TNC for duplex-digipeater
- Digital voice recorder
- Digital voice identification
- changeover of the supply voltage to 28 Volts
- Frequency and operating control system / mode control

The device in its original housing (425mm width x 149mm height x 368mm depth) is built for rack mounting. The handling will be done by the MIR crew, it is also possible to use remote control from the ground station (Moscow, R3K and Oberpfaffenhofen, DF0VR).

Mode-1: Relay Operation
=======================
On-board frequency: 437.950 MHz;
Ground frequency: 435.750 MHz,

accordingly 2.2 MHz frequency shift,
CTCSS tone for operation. 141.3 pl.(n6jlh)

The possibility for FM voice communications covering Europe is achieved. It depends on the users whether these communications can be realized. Radio discipline has first priority. For a special ground station working in undisturbed broadcast mode is possible by using special techniques.

Mode-2: Data Operation (Packet Radio)
=====================================
On-bord frequency: 437.975 MHz
Ground frequency: 435.775 MHz,
accordingly 2.2 MHz frequency shift,
no CTCSS tone operation.

Previous experience was gathered using packet radio on the MIR space station. The new device operates at 9600 Bd and echoes every data packet. With this concept, a higher data rate than with the former equipment can be achieved on one hand by the data speed, on the other hand the collisions of packets will be reduced to a minimum. There is also a lap-top PC available at the station for mailbox operation.

Mode-3: QSO-Operation of the MIR Crew
=====================================
On-board frequency: 437.925 MHz;
Ground frequency: 435.725 MHz,
accordingly 2.2 MHz frequency shift,
CTCSS tone for operation.

The cosmonauts can perform regular QSOs and can also carry out special functions with this device. Certainly in QSO operation it is very valueable that at the on-board frequency there are no other signals to be heart (communications discipline!).

In additionion, the cosmonauts have three other possibilities to use RR0DL:

1. In special cases a CTCSS tone can be switched to the transmission of RR0DL and DTMF tones can be used. The crew applies this in case they want to contact specific prepared stations. This is planned for emergency use, contacts with control centers and their families. Ground stations can be equipped accordingly, so that the cosmonaut can dial into a telephone system with DTMF tones in order to reach his XYL or another OM. If this is noticed other hams should not disturb!

2. Furthermore a digital voice recorder will be built into RR0DL. With that device the cosmonauts have the possibility to transmit a message worldwide. They record a text on the digital voice recorder and this text will be transmitted in regular intervals (duration up to 2 min, then 2 min breake). The German DLR Ham Radio Group added an identical device to

the already existing 2-m-equipment. The last messages
transmitted from MIR were New Year Wishes (1994),
Greetings to the HAM Fair Friedrichshafen (1994) and at the
EUROMIR 95 Mission.

3. Picture transmission, this part is new in the concept for
RR0DL. A system was developed for transmitting pictures in
digital form. The crew on-board of MIR can take pictures with
a still-video-camera and these can be stored in a lap-top PC.
The basis for the picture transmitting protocol is the AX.25
packet protocol. The picture pixels are transmitted in pseudo-
random kind. With this system recognition of pictures after
only 30 % transmission is possible. Missing pixels will be
mathematically added at the end of transmission. Transmission
time for one picture is 3 minutes. Amateurs can receive the
picture with a normal packet TNC with 9K6 modem and a
special software version from JVFAX (not available yet).

Ground Station for 430 MHz
==========
A normal FM-transceiver with an omni-directional antenna can be used
as ground station. Improved and easier is the operation, if
1. directional antennas
2. computer control for antennas and transceiver
3. CTCSS device
4. scanner operation for the SAFEX frequencies
5. narrow frequency intervals are available.

It has to be considered that the Doppler shift at 430 MHz can be up to 10
kHz. Special information for receiving equipment in future are given in
the mailboxes.

L/S-Band device
==========
This equipment is planned for experiments on amateur radio. The basic
module is working as a transponder with 10 MHz bandwidth, uplink
1265 MHz, downlink 2410 MHz. It is possible to plug different
experimental modules into the basic module. The ATV group at the
University of Bremen will develop and built the ATV equipment and also
the L/S-band basic part.

Experimental modules operate at the intermediate frequency 70 MHz, the
other parameters will be published later. So the possibility for the HAM
community is given, that in the future other communication experiments
at the MIR station can be realized.

Project SAFEX II Fact Sheet

Space AmateurFunk EXperiment
Amateur Radio Equipment for the Russian Space Station MIR

QRV on: 2 meters: RX and TX (Simplex)
70 cm: RX and TX (Duplex)
23 cm: uplink and 12 cm downlink
for voice, data, picture and ATV transmission

Transmit frequencies in the 430 MHz band:

437.925 MHz: direct frequency with the space station MIR,
QSO's with the cosmonauts, picture transmission and
automatically transmitted messages from the MIR crew;

437.950 MHz: repeater (relay operation); voice contacts between
ground stations;

437.975 MHz: data transmission; packet radio direct over greater
distances, mailbox operation with store and forward.

The ground stations transmit on a 2.2 MHz lower frequency. The Doppler
shift can be up to 10 kHz; the correction must be done at the ground
station.

Frequencies for the L/S-band-equipment:

Uplink: 1.265 Ghz
Downlink: 2.410 Ghz
Bandwidth: 10 MHz, linear translation or signals of the space station
(for example amateur television)

SAFEX-II Mission dates: launch spring 1996 as permanent service.

Callsign: RR0DL

Weight: up to 30 kg

Power supply: 50 Watts over a 24 hour period as well as additionally up
to 300 Watts for 2 hours from the on-board supply (28 V).

Operation: Under the control of the cosmonauts; additionally a remote
control is possible from Moscow (R3K) and Oberpfaffenhofen (DF0VR).
SAFEX-II is a project of the German Amateur Radio Club (DARC)
carried out by different groups under project management of the Ham
Radio Group at the German Aerospace Research Establishment (DLR)
Oberpfaffenhofen.

Hi Dave,

Could you be a bit more specific? I was unaware that a "repeater" was even aboard the MIR. I know that they carry an ICOM mobile 2m radio for phone and packet, but their having an actual repeater onboard is big news! Could you pass along the output freq and offset for those of us who are obviously MIR news challenged. And here I thought I was keeping on top of space stuff..

Earlier this year someone posted an article dealing with Rs-10/12 operation using an IC-706. Am I correct to assume that all you need to do is program two memories one for the two meter uplink and another for the ten meter down and just use the up/down buttons on the mic to go back and forth manually? Is there a better way?

David F. Salisbury
Stanford University, CA
(Phone: 415/723-2558)

NOTE TO EDITORS: N96-53

NASA BRIEFING WEDNESDAY ON DISCOVERY OF POSSIBLE EARLY MARTIAN LIFE

A team of NASA and Stanford scientists will discuss
its findings showing strong circumstantial evidence of
possible early Martian life, including microfossil remains
found in a Martian meteorite, at a news conference scheduled
for 1:00 p.m. EDT, August 7, at NASA Headquarters, 300 E. St.
SW, Washington, DC. The team's findings will be published in
the August 16 issue of Science magazine.

Panelists will be:

- Dr. Wesley Huntress, Jr., NASA Assoc. Administrator for Space
Science,
Washington, DC
- Dr. David McKay, principal author, NASA Johnson Space Center (JSC),
Houston, TX
- Dr. Everett Gibson, NASA JSC, Houston, TX
- Dr. Richard N. Zare, Professor of Chemistry, Stanford University, CA
- Kathy Thomas-Keprta, Lockheed-Martin, JSC, Houston, TX
- Dr. William Schopf, Professor, Department of Earth and Space
Sciences,
Univ. of California, Los Angeles

The briefing will be carried live on NASA TV with two-
way question-and-answer capability for reporters covering the
event from participating NASA centers. Audio of the
broadcast will be available on voice circuit at the Kennedy
Space Center by calling 407/867-1260.

NASA Television is broadcast on Spacenet 2,
transponder 5, channel 9, C-Band, located at 69 degrees West
longitude, with horizontal polarization. Frequency will be
on 3880.0 megahertz, with audio on 6.8 megahertz.

Instant Track is not shareware. Its author donated it to AMSAT years ago, and revenue from it goes to the amateur satellite programs. For ordering information, check www.amsat.org, or write to AMSAT.

While InstantTrack is not the newest or most feature-laden tracking program out there, it is still about the fastest and most convenient to operate real-time. I and many other people still use it for most of our day-to-day operations. And at about $50 for AMSAT members, $70 for non-members, it's a good deal.

If you want a good shareware tracking program, may I suggest STSPLUS for DOS (the author asks a very reasonable $10 or $15 for registration, and even calls this optional). The program is absolutely beautiful.

There's also WINORBIT for Windows, which is freeware.

Both these programs, and others are widely available on the AMSAT Web site, or ftp.amsat.org, or from BBS systems that feature a space/satellite, or astronomy-oriented area.

Hope this helps.

Here is info from AMSAT:

SB SAT @ AMSAT $ANS-216.03
SAFEX REPEATER CTCSS INFO

HR AMSAT NEWS SERVICE BULLETIN 216.03 FROM AMSAT HQ
SILVER SPRING, MD, AUGUST 03, 1996
TO ALL RADIO AMATEURS BT
BID: $ANS-216.03

Uplink 437.950
Downlink 435.750
CTCSS 141.3

Doppler compensation is required on both the uplink and downlink. (+/- 10
KHz) ,The uplink doppler is opposite from the downlink doppler. You
simply
see what your adjusting on the receive side, and correct the transmit
side in
the opposite direction.

[ANS thanks Mike, N1JEZ, for this SAFEX report.]

Radio Meteor Observation Bulletin No. 36 August 1996

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.41 Siedlce Poland 39 04h57(Sun05h57)-02h00(Sat03h00)
66.47 Viesintos Lithuania 12 05h00-22h00
66.50 Sofia Bulgaria 10 24hrs
66.56 Poznan Poland 56 04h57(Sun05h57)-02h00(Sat03h00)
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 06h00-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 o (= East),
elevation 27 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB

Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

July 1996

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

July | UT

Notes:

. local time = UT + 2 hours.
. % sporadic E
. radiant of the delta-Aquarids S (stream maximum on July 29)
rises at 21h UT and sets at 6h30m UT.
radiant of the alpha Capricornids (stream maximum on July 30)
rises at resp. 18h30m UT and 5h UT.
. ? high count to be checked for potential sporadic E.

Maurice De Meyere / Chris Steyaert

Location: Astronomical Observatory, University of Ghent, Belgium
(3 42' 32" E, 51 01' 25" N)
Antenna (2x): 4 elements horizontal Yagi, pointed East, elevation= 30 degs
Antenna amplifier: 10dB gain
Frequency: (1)=66.29 Mhz (signal) and (2)=65.3 Mhz (interference control)
Receiver (2x): modified commercial FM receiver
Data acquisition: 12 bits PC-based A/D convertor, 250 Hz sampling rate
Interference rejection:
dual setup: receiver (1) tuned at distant transmitter, receiver (2)
tuned at empty frequency. Anticoincindence measurement rejects
registration of broadbanded spurious signals (lightnings, computers,
ignition motors, etc).

Further information:
see WWW page (additional info + observational data)
http://allserv.rug.ac.be/~hdejongh/astro/meteor/meteor.html
Data format:
results are shown as total reflection time, expressed as
a percentage. The actual number shows 10 times this value.
When no figure is shown, the equipment was either out of service,
or results could have been affected by interference, sporadic E.

```

. lots of sporadic-E during July, fortunately not hampering much
the observations of the morning streams at the end of the month.
. delta Aquarids and alpha Capricornids activity between July 27-31.
. ? high counts to be checked for potential sporadic E.
. reports from the US of high reflection activity on July 23, 14h-17h UT
cannot be confirmed from the above observations. If it would have been
meteor activity, then the radiant wasn't placed favorably for Europe.
Sporadic E might have influenced the counts.

2. ABOUT THE RMOB

The RMOB is an independent initiative of some workers in the field of radio meteor scatter observations and data reduction. It started in August 1993 in order to spread rapidly the Perseid results via E-mail. Since then, it has appeared monthly, and it has gradually been expanded. In regularly publishing summaries of observations, potential radio observers are kept up to date of existing installations, possibilities and limitations of radio meteor observations. In the long run, there should be sufficient observing

stations to cover the whole globe, allowing to detect stream outbursts which may remain unnoticed visually.

RMOB contains typically: summaries of recent observations, equipment data, first results of stream activity by radio methods, relations between radio and optical meteors, references to other publications in the field of meteor astronomy and radio scatter techniques, announcements of meetings, short questions and answers, non-commercial (second hand) sale of radio equipment, available software.

Contributors are mentioned, and interested persons are asked to contact them directly.

RMOB can be copied freely in unabridged and unmodified form. Extracts should indicate the source (Radio Meteor Obs Bulletin, month and year).

If you want to subscribe (or unsubscribe) to the E-mail distribution list, please send a message to C. Steyaert.
Those not having access to E-mail can obtain a printed copy free of charge from J. Van Wassenhove (current or back-issues).

1525. FS: Brand New Satelite Antennas and Rotor

Newsgroup: rec.radio.amateur.space
Date: 1996-08-07 00:00:00 UTC
From: Mary Ellen Powers <mpowers@ne1h.radio.org>
Message-ID: <01bb8490$7f497c20$b4c41cce@hurricane.ne1h.radio.org>
Source record: 21798
Cross-posted to: rec.radio.amateur.space,rec.radio.swap

All,

I have to following for sale, these are brand new and never used.

Yaesu 5400B Rotor
KLM 2m 22 element array (Satellite version switchable polarization)
KLM 440 40 element array (Again satellite version switchable polarization)
7 ft. Fiberglass cross arm
AEA ST-1 Satellite tracking hardware
NOVA v1.0 and 1.1 and Nova for Windows (updated to the windows version at Dayton)

Would like to keep together. Again, the Antennas are in original shipping cartons and have never been opened, the Rotor I took out of the box to look at, but it has never been out of the house. I hooked the ST-1 to the rotor and then the system to a PC and watched the rotor work, but none of it has been "on the air".

Will make a great beginning start to the antennas of a satellite station.

Would cost way over $1000.00 to purchase new. I would like to get between $600-$700 for the complete setup and Buyer pays shipping. Offers accepted. please email to ne1h@ne1h.radio.org

Thanks,
Alan Adamson
ne1h@ne1h.radio.org
Atlanta, GA - local hams could pick up and save some $$$ on shipping

Shareware of IT? I don't think there ever was one.. A couple years
back the program found it's way onto a shareware CD ROM, the author of
InstantTrack (Franklin Antonio) sued the CD ROM people for this
mistake.. It's possible that I am wrong that there is no SW of IT,
but I doubt it.

From: id4eagle1@aol.com
Message-ID: <4ueuqf$pca@newsbf02.news.aol.com>
Source record: 21802

Hello,

On Friday the 16th of August, there will be a launch of
a rocket which carries a Timble GPS and ATV package.
The GPS data will be overlaid on the video. The power
output of the transmitter (Ground Plain 1/4 wave) is
10w. The frequency is 434Mhz, and the expected altitude
is 100k feet.

The launch will occur from Black Rock dry lake bed, which
is ~130mi NNE of Reno Nevada. The flight is scheduled
for 08:00.

Anyone is welcomed to tune in if they have the equipment, and/or if the
signal reaches repeaters. I would expect that line of sight, should allow
the signal to reach Reno from ~20mi up.

Please email me if you happen to recieve any signals.
Thankyou,

Jonathan Dunbar KE6WBO

1530. Help with AO-27 RS10

Hello all,
I am new to making contacts via the use of satellites.
I have heard Mir 4 times and tried calling 5. No luck as of yet.
With each pass I learn a little bit more about what I have to do to get that
QSO. I was wondering at what distance hould I try to give AO-27
and Rs10 a call. I realize that they are two different birds with different
operating habbits. My concern is the distance. At what range do you all
make you contacts. (Km) ? My tracking program is a simple text output line by
line with all the necessary data. (it has worked for the Mir so far..)
Should I start calling when theyare within 800km? 1000km? 300km?
Thanks for all the help.

Hello all.

I am brand new into amatuer satillite work. All I know is that sombody told me I COULD do sat work with my 50 watt VHF rig, and 35 watt UHF rig.

Is this true, and if so, where do I start? Does this group have an FAQ?

Any info would be appreciated.

Thank you.

Yep - 'tis all true, but you should get across to your college library and ask for references to ARRL publications. Aside from "The Satellite Experimenter's Handbook, there are extensive explanations in the regular ARRL (BIG) handbook on ham radio, and the famous antenna handbook too.

You will find histories of the OSCAR satellite ham operations, as well as what is current. When you know what "Keplers" are, and can predict the time a sat comes over the horizon, you can begin to think about what it takes to make contact with one. Working sats is not plug 'n play. You are going to have some weeks of dandy delving. Have fun..

1533. interferometers?

Newsgroup: rec.radio.amateur.space
Date: 1996-08-09 00:00:00 UTC
From: mundaka@acca.nmsu.edu
Message-ID: <4uejn7$g80@bubba.NMSU.Edu>
Source record: 21806

Just a question that has been nagging me for awhile:

Is it possible to array used satellite antennae in such a way that they could be used as a small radio telescope? I know the baseline of a satellite dish is far too short, but it seems--to one who is unfamiliar with the topic, at any rate--possible to use today's powerful PC's to integrate the data of each dish into a useful interferometer.

On a related note, could such interferometers be grouped into <gads!> interferometers of interferometers?

The idea is to use (soon to be) obsolete dishes--and hopefully obsolete computers as well--in a relativly cheap method of doing radio astronomy (which I have a *lot* to learn about, unfortunatly.)

Thanks,
chris

Whoa! Great idea, but you leave sooo much to ones imagination. This project is a prime candidate for a web page expalining the whole process, the people involved, the evolution of the idea, PICTURES of the rocket etc etc etc..

I'd love to read more abouth this exciting project.. If you don't have the time and/or know-how to write a web page on your rocket project, I'd be happy to do it for you (at no charge, of course.) Just send me a packet of pics and information on the project and I'll get right on it, shouldn't take more than a day of my time to put it all in HTML, including scanned pictures off my color flatbed scanner, I can then email you the whole document and pics so you can post the page to your server or I'd be happy to put it on my server. I'd then mail back to you any and all material that you send.

If your interested, drop me an email and we'll get it going!

Take Care and 73's

I am assuming (I know that is dangerous) that you are interested in
making 2 way contacts thru a satellite. I am also assuming that your
radio equipment operates in the FM mode.

There are two possibilities that quickly come to mind. First, is
AO-27. Uplink on 145.850 and downlink on 436.800 MHz (+/- a few KHz
for doppler shift). This bird has a VERY sensitive receiver, so use
LOW power on the uplink. The downlink is rather weak so a small beam
and a pre amp will help a lot.

Second, is the new Safex II repeater on Mir. Uplink is 435.750 and
downlink is 437.950 MHz (again, +/- 10 KHz doppler shift). You will
need to use a CTCSS tone of 141.3 to access this machine.

As a general rule, you should work on your receive station first.
Listen to several passes to learn operating protocols. Never transmit
unless you can clearly copy the downlink.

I highly recommend "The Satellite Experimenters Handbook" which is
available from Amsat or ARRL. The Amsat web site has a great deal of
useful information.

I also recommend joining Amsat. The newsletter is quite informative
and part of your dues goes toward building and launching satellites.

I must warn you that satellite operation can be very addictive! I
worked very hard learning code and theory so I could work DX on the HF

bands. About three years ago, when I started working satellites, I had 311 countries confirmed and I only needed 2 more on 80 meters for five band DXCC. Today, I have 311 countries and I still need the last 2 on 80!

I've been using it at work under Win95. It works fine in full screen
mode. In a window, the disply updating is goofy, to say the least. All
the text mode stuff is fine, but when you go into graphics to show the
maps, the satellite position and access circle can loog very strange at
times.

If you're referring to the fact that when in the map screens, the text
underneath looks like gibberish, this is really a problem of the video
card, not Win95. There is now a "patch #4" for IT available on AMSAT's
web site (www.amsat.org) which fixes the problem. Alternatively, Franklin
Antonio (IT's author) recently posted on the AMSAT-bb that a little TSR
BIOS patch made available by a video card manufacturer restores the needed
functions that many recent cards have left out.

Hi John, My problem is that Win95 won't accept a TZ statement in the
autoexec.bat file and my version of IT does not show the correct UTC which
makes it useless except for the pretty pictures. I haven't figured out how
to beat this. I guess the solution would be to set my computer's clock to
UTC but I have been trying to avoid this. Right now with AO-13 not
accessible during "business hours" in my neck of the woods the problem is
academic. Like I say its a beautiful program. No sat. program graphics come
close. 73, W2BY

1543. Antennas for MIR

Newsgroup: rec.radio.amateur.space
Date: 1996-08-11 00:00:00 UTC
From: Mark <kb9khm@expert.cc.purdue.edu>
Message-ID: <320E900B.30BD@expert.cc.purdue.edu>
Source record: 21816

I seem to have a LOT of fading while listening to the new 70cm repeater on MIR with my horz. polorized beam. I was wondering if any one had any oppinions on what type of antenna system would work best with the new repeater. I'm curious about trying circularly polarized antennas (don't have any right now, but I'd build one if that was the way to go) and wondered "if circular polorization is the way to go . . . should it be right hand or left hand?"

Any thoughts would be greatly appreciated!

Mark <KB9KHM>

From: Jake Brodsky <frussle@erols.com>
Message-ID: <320F810D.2B5E@erols.com>
Source record: 21818

Interfermetrics only work well if you can accurately determine your position, relative to the other station down to a reasonably small fraction of the wavelength you're using. They also only work well if you have a very accurate frequency standard. This, however, is something you can achieve with GPS. As for the latter, I have no idea how radio astronomers do it.

Yes. (grin) How, I'm still working out myself. Synchronization is
the key.

>On a related note, could such interferometers be grouped into <gads!>
>interferometers of interferometers?

Interesting idea - referring to my previous comment, a common time
base could be used.

>The idea is to use (soon to be) obsolete dishes--and hopefully obsolete
>computers as well--in a relativly cheap method of doing radio astronomy
>(which I have a *lot* to learn about, unfortunatly.)

Even new gear is pretty cheap, take a look here:
http://www.dbsdish.com/message/forsale.html and here:
http://www.datasat.com/price.html#antennas and here:
http://www.dbs-online.com/DBS/SatWarehouse/BUD/Reflectors/Orbitron.html
and ESPECIALLY here:
http://www.dbs-online.com/DBS/SatWarehouse/BUD/HH_Mounts/index.html
(they have an antenna mount that LOOKS like it would be perfect for a
drift-scan telescope, and pretty cheap, too!).

>Thanks,
>chris

Chris,

Check out the various Radio Astronomy Pages on the web (use the search
engines).

There's also the SARA group (the Society of Amateur Radio
Astronomers).

Try this link for starters: http://www.nitehawk.com/rasmit/ws1_4.html

Good Luck,

-Ralph-

1548. FS: Kantronics DataEngine and complete 96/1200 baud packet setup

All,

I have the following for sale. All is complete and working.

1) Kantronics DataEngine
2) Tekk KS-900 UHF data radio on 441.000
3) Tekk KS-960 UHF data radio on 441.000
4) Alinco 1200T 1200 baud data radio (synth'd)
5) Pacomm TNC-2 (can't remember model number w/DCD)

All cables, power supplies, etc. Tuned, tweeked (for deviation) and ready
to go!

Looking to sell as a complete set and I would like to get around 700.00 for
the set. Please email any offers to ne1h@ne1h.radio.org

Thanks,
Alan Adamson

1549. MIR Repeater

Newsgroup: rec.radio.amateur.space
Date: 1996-08-13 00:00:00 UTC
From: mbv@ti.com
Message-ID: <4upuld$4ga@tilde.csc.ti.com>
Source record: 21672

The repeater signal is strong and I hear stations loud and clear (with some QSB), but can't seem to hit it. I'm using 40 el RCP for the uplink with only 5 W from an HT (FT470). Is the tone really 141.3 as is posted previously here? As strong as the signal is, it would seem that 5W and 40 el should be sufficient. I'm thinking that the subaudible tone may not be correct. Any ideas?

Ken K5MBV mbv@ti.com

1550. Re: MIR Repeater

1551. Phase 3D bandplan

Newsgroup: rec.radio.amateur.space
Date: 1996-08-13 00:00:00 UTC
From: dhoward@mail.hol.gr
Message-ID: <4ur293$5ol@news.hol.gr>
Source record: 21674

Hello,
I am planning for the new P3D and wonder if anyone has the bandplan. I have the freq list of all the transponders, but it does not indicate what bands will work with each other and at what times. Basically, what I am looking for is what uplink freqs work with what downlink freqs. I am gearing up some systems and want to optimize for the higher microwave bands. Appreciate any info anyone can pass to me either via this forum or by email: dhoward@prometheus.hol.gr

Thanks

Dana W0BOV

My apologies to the group and to all the Instant Track loyalists. I did not
have the proper SET TZ+ statement in my autoexec.bat. Thanks to the several
of you who helped me with this. Check my signature for the real reason.

1554. NORAD Two-Line Orbital Element Sets (TLE850)

Newsgroup: rec.radio.amateur.space
Date: 1996-08-13 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4uqvva$4o4@blackbird.afit.af.mil>
Source record: 21677

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Is there a satellite capable radio out there that tracks doppler and
compensates for it automatically?

>Forgot to mention: I tried 5 and 10KHZ offsets for Doppler with no luck..

When you were receiving at 10Kkhz offset did you xmit at 10Knz
the other direction from the center freq.

Also I have read you need 50 watts with a 7 element ant.

I have 50 Watts with a 3 element and can't seem to make it.

Hi,
I am using Homeplanet with Windows 95. I have not been able to
find a way of setting the time to UTC. I have used the command in
Autoexec as suggested in the help file but it still reverts to Pacific
Standard Time.

Any help would be appreciated

Source record: 21685

Turn a measly $5 into $50,000!

Taking 5 minutes to read this text may be one of the best decisions you

ever made.

I could make $50 000 within 4 weeks for an investment of only $5. I

thought it was a huge joke! I spoke to my friends about it

and they thought likewise. But after three days of desperate struggle

I decided I had nothing to lose.

My family and I sent $1 by snail mail to each of 5 names and addresses

specified in the article. We then

placed our own name and address in the article and posted it in 200

other newsgroups.

Two weeks later, I started receiving money in the mail! I could not

believe it! Hundreds of dollars turned into thousands, and in the 4

weeks,

I received a total of $53,654. It came from all over the world.

If you follow the 3 steps below, there is no reason whatsoever why the

same shouldn't happen to you. This is a perfectly legitimate investment

opportunity. You invest $5 and you receive a return on your investment.

So does the next investor. NOT ILLEGAL, NOT A CHAIN LETTER - PERFECTLY

LEGITIMATE!

OBVIOUSLY, IF YOU ARE NOT INTERESTED, THEN DON'T PARTICIPATE. BUT

PLEASE

PRINT THIS ARTICLE AND GIVE IT TO SOMEONE WHO MAY WISH TO TAKE

ADVANTAGE.

The procedure is very simple.

STEP 1. Write your name and address on 5 separate pieces of paper with

the words "PLEASE ADD ME TO YOUR MAILING LIST". Fold a $1 note or money

order or bank draft in each of the pieces of paper and mail them to the

following five addresses:

****

1. Qunwei Yu, 11405 Tiverton Court , St.Louis, MO 63146

2. Nat Heatwole, 7550 Damascus Rd., Gaithersburg, MD 20882

3. Jeff Katz, 7 Seir Hill Rd, #41, Norwalk, CT 06850

4. Eric Johnson 14817 Holden Circle, Horizon TX, 79927

5. Patrick McElroy 818 Hollow Creek Dr. Newbern, TN. 38059

****

STEP 2. Now remove the 1st name on the list, move the other 4 names up

(5 becomes 4, 4 becomes 3 etc) and put your name and address as number

5 on the list. You can do this by re-typing this article or simply

editing and re-posting it in this or another newsgroup.

STEP 3. Post your amended article to at least 200 new groups (there are

17 000 of them).

You are now in the Mail Order Investment Business and you will start

receiving $1 returns by mail within a week or two. The more newsgroups

you post to, the bigger your return will be. You may want to rent a

Post

Office Box to handle the volume of mail you are likely to receive.

If you wish to remain anonymous, you can use a pseudonym such as

"The Manager" or "The Investor", but make sure your address is correct!

NOW LET ME TELL YOU WHY THIS SYSTEM WORKS!

Of every 200 postings I made, I received an average of 5 replies, YES -

ONLY 5, each with a $1 bill enclosed. You make $5 for every 200

postings WITH YOUR NAME AT NUMBER 5.

Each person who sent you $1, now also makes let's say,only 200

additional postings WITH YOUR NAME AT NUMBER 4, i.e. 1000 postings.

On average therefore, 50 people will send you $1 with your name at

number 4. You make $50.

Your 50 new agents make 200 posting each WITH YOUR NAME AT NUMBER 3

or 10 000 postings - average return 500 at $1 each is $500. They

make 200 postings each WITH YOUR NAME AT NUMBER 2 = 100 000 postings

= 5 000 returns at $1 each = $5 000.

Finally, 5 000 people make 200 postings each WITH YOUR NAME AT NUMBER 1

and you get a return of $50 000 before you name drops off the list.

AND THAT'S IF EVERYONE DOWN THE LINE ONLY MAKES 200 POSTINGS! Total

income in one cycle = $55 500.

From time to time, when your name is no longer on the list, you take

the latest posting that is appearing in the newsgroups, SEND OUT

ANOTHER $5 TO THE NAMES THAT ARE ON THE LIST, PUT YOUR NAME IN

AT NUMBER 5 AND START POSTING AGAIN. Remember, 200 postings is only

a guideline. The more you post, the greater the return.

Let's review the reasons why you should do this: THE ONLY COST FACTORS

ARE 5 STAMPS, 5 ENVELOPES, AND 5 $1 BILLS. Anyone can afford five

dollars to put into such an effortless investment with SPECTACULAR

RETURNS.

Some people have said to me "What happens if the scheme is 'played

out' and no one sends me any money"? Big deal! So you lose $5 - but

what are the chances of that happening?

Do you realise how many Internet Users there are? Do you realise how

many times this scheme can be utilised over and over again - with COMPLETELY NEW people participating?

There are not HUNDREDS, NOT EVEN THOUSANDS, BUT HUNDREDS OF THOUSANDS OF NEW INTERNET USERS EVERY MONTH!

Remember, read the instructions carefully and play FAIRLY...that's the only way this will work. Get a printout so you can refer back to this article easily.

Try to keep a list of everyone that sends you money and always keep an eye on the newsgroup postings to make sure everyone is playing fairly. You know where your name should be.

Has the repeater been turned off?

I have made several QSO's via the MIR repeater. It doesn't seem to be on anymore when I listen. Do they have a schedule of activity for the repeater?

I hear the beacon messages on 435.725 +/- doppler OK (announcing the new crew as of Monday) and I hear a Russian signing RR0DL CQ. Haven't been able to raise him or hear him come back to anyone else. Has anyone made a two way on the QSO channel?

Perhaps the repeater will come back after the crew exchange.

Mel, K2JWD

From ARRL Headquarters
Newington, CT August 17, 1996
To all radio amateurs

SB SPACE ARL ARLS011
ARLS011 JAS-2 In Orbit

JAS-2, the first Amateur Radio satellite launched in 1996, is in orbit. Early Saturday morning, August 17 (UTC), an H-2 rocket blasted off from Japan's Tanegashima Island space center carrying the JAS-2 Amateur Radio satellite. The satellite was successfully deployed in orbit 38 minutes later.

JAS-2 is similar to OSCAR 20, although it offers some interesting twists. As soon as testing is completed and the satellite is open for general use (approximately three days), hams will have access to an easy-to-use packet BBS. Unlike most digital satellites which function as file servers and require specialized ground station software, JAS-2 provides a BBS that operates much like a terrestrial system. The only software required is a terminal program to ''talk'' to your TNC. Connecting to the BBS is as simple as sending a connect request to 8J1JCS.

Hams who own PSK TNCs can connect to JAS-2 at 1200 baud. But unlike OSCAR 20, JAS-2 can handle 9600-baud FM FSK as well.

A digital voice-storage unit (called the ''Digitalker'') will be used to transmit announcements, bulletins on the condition of the satellite and so on. It's similar to the unit presently being heard from the Mir space station.

JAS-2 also features a linear transponder for SSB and CW communication. At this time there has been no word from the Japan Amateur Radio League concerning an operating schedule for the transponder vs the BBS. The satellite has also not yet received its OSCAR designation.

Congratulations to JARL and JAMSAT on the successful launch of JAS-2. And many thanks to Kazu Sakamoto, JJ1WTK, and Fujio Yamashita, JS1UKR, for keeping ARRL HQ informed throughout the

project.

1578. ORBITAL ELEMENTS FOR JAS-2

Newsgroup: rec.radio.amateur.space
Date: 1996-08-18 00:00:00 UTC
From: "Bernard A. Poskus and Cheryl A. Blehm-Poskus" <hamdan@ix.netcom.com>
Message-ID: <4v8a6g$4gl@dfw-ixnews5.ix.netcom.com>
Source record: 21701

August 18, 1996, 23:49UTC

Hello and thanks for reading this message. Does anyone have an orbital element set for JAS-2? I've seen where several stateside hams have already heard its beacon. If anyone has the elements, I would appreciate it if they could either e-mail me (hamdan@ix.netcom.com), or post them to this newsgroup.

See you on the birds! 73's de Bernie, KF0QS

1579. MIR pass Aug 18 1650 CDT Dallas

Newsgroup: rec.radio.amateur.space
Date: 1996-08-18 00:00:00 UTC
From: mbv@flash.net
Message-ID: <4v84ik$t8@excelsior.flash.net>
Source record: 21702

Just finished turning off the FT470 after listening on the beacon and the repeater downlink frequencys. There wasn't a signal on either one. Does anyone know what kind of schedule to expect? Could there be some kind of power rationing involved? Operating a repeater shouldn't disturb the crew since the speaker could be turned off.
A few days ago, the repeater signal was very strong and I could hear a number of contacts being made. My 141.3 tone wasn't working at that time and so I couldn't make a contact with the talkie. Does anyone have the straight scoop on MIR SAFEX schedule and system requirements? The 40 el RHCP beam gets a good signal and should put up enough from 5W to work if there isn't a high noise level or tight squelch on the MIR receiver.

Ken K5MBV

Steve

PL means Private Line (a Motorola trademark)
CG means Channel Guard (a General Electric trademark)
QC means Quiet Channel (a RCA trademark)
Johnson, Aerotron, Kenwood, Icom, Regency, Tandy and anyone else that
makes two way radios may come up with another name for it.

They all mean CTCSS (Continious Tone Coded Squelch System).

Does this help or make things more unclear.

As you see many things mean the same thing.

"CTCSS" and "PL" (private line) are both the same. "Private Line" was a name that GE (I think) gave to its commercial radios when they first put CTCSS in them, and the term spilled over into the ham community.

Take care.

Depends on whether you own stock in Motorola or not. PL is Motorola's
trademarked name for CTCSS.

PL is Motorola's trademark. GE calls it CG, Channel Guard. But they're
both CTCSS just the same.

When you were receiving at 10Kkhz offset did you xmit at 10Knz
the other direction from the center freq.

Also I have read you need 50 watts with a 7 element ant.

I have 50 Watts with a 3 element and can't seem to make it.

1586. More newbie help

Newsgroup: rec.radio.amateur.space
Date: 1996-08-19 00:00:00 UTC
From: cgreenha@magnus.acs.ohio-state.edu
Message-ID: <cgreenha.589.3218724B@magnus.acs.ohio-state.edu>
Source record: 21709

Hello all.

I would first like to thank all of you who responded to my intitial call for help...it was most appreciated!

However, it seems that all of the UHF freqs that were sent, were unable to transmit from my rig. I have since found out that "multi-mode" rigs are needed for much of the sat bands, so, let me ask my query again, being more specific...

Can I do any sat work with an FM only voice/packet VHF rig (Kenwood 241a), and a FM only voice/packet (9600) UHF rig (Kenwood 451a)? Both can operate simultaneously.

Any comments/recommendations about tracking software are welcomed also.

Thanks much, & take care.

Forwarding message from Fujio Yamashita, JARL;

----- Begin Included Message -----
From:Fujio Yamashita, JARL
Date:August 18, 1996
Subject:JAS-2 Keps

Hello Tak,
JAS-2 seems normal at present. Initial operation is
progressing, to build
up whole system in every pass. Please wait for half a month
until JD
transponder will be ready.
Here I would like to send you PROVISIONAL Keps in two lines
obtained by
analysis with several observation results of Doppler shift of
beacon
frequency and preliminary orbit of rocket.
Using this, antenna and frequency tracking at our station went
good, so
we may open this as provisional Keps, for the time being.
These are:

JAS-2
1 09999U 99999C 96231.03798611 -.00000037 00000-0 -10627-4 0
9997
2 09999 98.3839 306.3820 0348080 248.3459 228.0273
13.52548600000127

Orbit number counts "1" for the first pass of ascending node.

This is for reference, soon we will be able to get NASA two
lines, when
we will open it as before.
I mailed the Keps to Russ Tillman KC5JVB and Paul Williamson
KB5MU.

Thank you for your cooperation.
Best regards and 73, Fujio Yamashita, JARL

1589. NORAD Two-Line Orbital Element Sets (TLE854)

Newsgroup: rec.radio.amateur.space
Date: 1996-08-19 00:00:00 UTC
From: tkelso@afit.af.mil
Message-ID: <4vatkn$quj@blackbird.afit.af.mil>
Source record: 21712

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

****

Electronics Resource Internet Addresses Needed
for Publisher.
==============================================
To all Electronics Companies, Service Person-
nel, Webmasters & Hobbyists,

I am preparing a book tentatively titled "Sam's
Internet Guide to the Electronics Industry", to
be published by Howard W. Sams & Co. and PROMPT
Publications. The book will contain site add-
resses for electronics resources. Companies,
organizations and individual web creators are
encouraged to fill out a simple FORM at the ad-
dress below.
-----------------------------------------------
http://web.idirect.com/~ifx/book/
-----------------------------------------------
In addition, any electronics related addresses
or resources you run into while surfing please
let me know by filling out said form.

If you lack FORMS capability send an email with
the info below. I am especially interested in
sites offering simple electronics repair data,
service specs and hobbyist help-pages. Other
resources are more than welcome. Top Urls will
be printed in this directory and updated in
future issues.

1591. Re: interferometers?

Newsgroup: rec.radio.amateur.space
Date: 1996-08-20 00:00:00 UTC
From: kmec@aol.com
Message-ID: <4vbenp$jas@newsbf02.news.aol.com>
Source record: 21714

In answer to your question about interferometer systems made out of old sat equipment/dishes. Been done and works for radio astronomy. Excellent material on topic available from Jeff Lichtman, Radio Astronomy Supplies 190 Jade Cove Drive, Roswell, GA 30075, (404)-992-4959. Good books by W. Lonc and Bob Sickels.

I am a member of SARA (Society of Amateur Radio Astronomers). Jeff Lichtman helped found this group years ago. Many have done neat stuff. Why re-invent the wheel. Have fun.

Subject: 2M lowcost aerial for receiving only

I'm interested in the Telemerity from the Oscar series of satellites and
was courious if there was any aerials that were cheep to make that didnt
require constant moving to chase the satellite.

>Forgot to mention: I tried 5 and 10KHZ offsets for Doppler with no luck..

When you were receiving at 10Kkhz offset did you xmit at 10Knz
the other direction from the center freq.

Also I have read you need 50 watts with a 7 element ant.

I have 50 Watts with a 3 element and can't seem to make it.

One post said ctcss 141.3 and one post said pl 141.3 .which is it?
thanks 73 steve

SB SPACE ARL ARLS011
ARLS011 JAS-2 In Orbit
```

JAS-2, the first Amateur Radio satellite launched in 1996, is in orbit. Early Saturday morning, August 17 (UTC), an H-2 rocket blasted off from Japan's Tanegashima Island space center carrying the JAS-2 Amateur Radio satellite. The satellite was successfully deployed in orbit 38 minutes later.

JAS-2 is similar to OSCAR 20, although it offers some interesting twists. As soon as testing is completed and the satellite is open for general use (approximately three days), hams will have access to an easy-to-use packet BBS. Unlike most digital satellites which function as file servers and require specialized ground station software, JAS-2 provides a BBS that operates much like a terrestrial system. The only software required is a terminal program to ''talk'' to your TNC. Connecting to the BBS is as simple as sending a connect request to 8J1JCS.

Hams who own PSK TNCs can connect to JAS-2 at 1200 baud. But unlike OSCAR 20, JAS-2 can handle 9600-baud FM FSK as well.

A digital voice-storage unit (called the ''Digitalker'') will be used to transmit announcements, bulletins on the condition of the satellite and so on. It's similar to the unit presently being heard from the Mir space station.

JAS-2 also features a linear transponder for SSB and CW communication. At this time there has been no word from the Japan Amateur Radio League concerning an operating schedule for the transponder vs the BBS. The satellite has also not yet received its OSCAR designation.

Congratulations to JARL and JAMSAT on the successful launch of JAS-2. And many thanks to Kazu Sakamoto, JJ1WTK, and Fujio Yamashita, JS1UKR, for keeping ARRL HQ informed throughout the project.

Notes
-----

1. NORAD Catalog Number is also known as U.S. Space Command (USSPACECOM) object number and NASA catalog number.
2. No orbital plane position = satellite no longer operational.
3. Clock: Rb = Rubidium; Cs = Cesium.
4. Selective Availability (S/A) had been enabled on Block II satellites during part of 1990; S/A off between about 10 August 1990 and 1 July 1991 due to Gulf crisis; standard level re-implemented on 15 November 1991; occasionally off for test and other purposes. Currently, PRN15 and PRN28 appear to have little or no S/A imposed.
5. Anti-spoofing (A-S) was activated on 94-01-31 at 00:00 UT on all Block II satellites (ref. NANU 050-94042); occasionally off for test and other purposes. A-S was turned off on all satellites at 20:00 UT on 95-04-19 and back on on 95-05-10; off again between 95-06-19 and 95-07-10; and between 95-10-10 and 95-10-31. A-S has been off on PRN28 since 95-02-21.
6. PRN number of SVN32 was changed from 32 to 01 on 93-01-28.
7. PRN05 and PRN06 are equipped with corner-cube reflectors for satellite laser ranging (SLR). SLR tracking of the satellites will permit onboard clock errors and satellite ephemeris errors in GPS tracking to be differentiated.
8. The decommissioning date for PRN06/SVN03 is the date of termination of operations of this satellite (ref. USNO) and is about 3 weeks later than other published dates for "deactivation".
9. PRN10 (SVN40) was launched on 96-07-16 at 00:50 UT. It achieved initial usable status on 96-08-15 at 15:05 UT (ref. NANUs 120-96204,133-96228).
10. PRN16 will be moved from the E-3 slot to the E-5 slot to make room for PRN10. An orbit maneouvre was carried out on 96-08-19 (ref. NANUs 120-96204, 137-96232).
11. PRN20 hs been unusable since 15:18 UT on 96-05-10 and will not return to service (ref. NANU 118-96204). Alamanc data was still being produced into GPS Week 867 although the satellite was marked unhealthy. Not previously reported in this table was a clock change from Rb to Cs on 96-01-13.
12. PRN28 is in the process of being moved from the C-2 slot to the C-5 slot, about 40 degrees away. This move, which was initiated on 96-03-06 by lowering the orbit of PRN28 by about 6 km, made way for PRN03. PRN03 is a backup for PRN28 which has some undisclosed equipment problem. PRN28 will remain on the air, with some subsystems shut down to conserve power (ref. NANUs 045-96066, NANU 068-96100, and GPS World Newsletter). The move should be completed on 96-08-23 (ref. NANU 127-96236).
13. Announced date of next scheduled launch: 96-09-12.

>I am preparing a book tentatively titled "Sam's
>Internet Guide to the Electronics Industry",

Um, this is yesterday's solution. Back in the dark ages of the internet (18 months ago) I used to use a book called the internet yellow pages. With the advent of the search engine (Alta vista, Lycos, Deja News etc...) it is easier and quicker to do an online search.

Good luck, I think you will need it.

1599. updated TLE's for JAS-2

Newsgroup: rec.radio.amateur.space
Date: 1996-08-20 00:00:00 UTC
From: Charlie Panek <charlier@lsid.hp.com>
Message-ID: <321A42E2.2581@lsid.hp.com>
Source record: 21722

In looking at the latest TLEs from archive.afit.af.mil, it looks like
NORAD has some tles for JAS-2. ADEOS is listed as object 96046A, and
from browsing the JAS-2 web site, I know that JAS-2 was launched along with
ADEOS. There are also items 96046B and 96046C. 96046C seems to be nearby
ADEOS (spent booster?), but 96046B seems to have elements very near the
preliminary elements previously posted here for JAS-2.

In any event here they are:

1996045B
1 24274U 96045B 96231.07641075 .00279394 78181-5 38351-3 0 93
2 24274 62.8034 236.9004 0167732 131.2656 230.3283 15.84320817 503

BTW, I tried listening for it last night, based on those preliminary
elements, but only heard FO-20, which also happened to be above the
horizon at the same time. (FO-20 has 3 digit telemetry numbers, as
opposed to JAS-2, which has only 2 hex digits.) Of course my antenna
(a whip) is not the greatest, and it was only a 20degree elevation pass...

For LEO satellites with CW or PSK downlinks, like RS-10, RS-12, AO-16 or LO-19, you can use a simple groundplane antenna. See www.amsat.org for frequencies and other info.

IT'S ANOTHER WINDTRAX
AMATEUR RADIO BALLOON FLIGHT!

All are welcome to participate and join in the fun!
We expect this to be another successful ATV, Repeater,
and GPS/packet flight of approximately 2-3 hours duration,
and the pre-flight and post-flight nets will extend the fun.
Join us!

DATE: August 24, 1996
TIME: 1200-1300 UTC (0700-0800 Indiana time) Wx dependent
LAUNCH SITE: Purdue University Airport, Lafayette, IN.

Prelaunch Freq's: HF check-in @ 3.869-3.871MHz
2 meter locals 147.135/R (W9YB)
Nets will begin at 1130 UTC

Flight Package's:
Crossband repeater provided by W9DUU, Paul
2m rcvr to 6m & 70cm xmtrs, with voice ID
Using half-wave antennas and 100mW.

GPS/Packet system provided by WB9QPG, Dave
Garmin GPS rcvr, controlled by MIM packet & downlinked to 145.79MHz xmtr, lithum powered.
1/4 wave antenna, 100mW output.

ATV package by KT9V, Terry
Contains two B&W CCD camera's & a WB8ELK color
video graphics card. Downlinked on Wyman ATV xmtr via 1/4 wave antenna. Lithum powered, the
cameras are aimed horz. and vert, with controlled switching.

Flight Freq's:
Crossband Repeater Dwn 52.525 & 444.85MHz
(50mW & 100mW) Up 144.3MHz
GPS/Packet: Dwn 145.79MHz @ 1200 Baud,(VP) 100mW out
ATV: Dwn 439.25MHz (VP) 1.5 watts output

Balloon Type: Kaymont 1200 Gr.
Parachute: Custom made by KB9BSV, Barb, is 5' in diameter

We welcome your email notes regarding your reception!

1603. Beat the pile-ups>>Cyberscheds now Available @ sarrio.com

This is a new use of the WWW that can benefit ham radio operators throughout the world.

You can now schedule contacts with hams all over the world simply and easily by using the WWW and e-mail.I have set aside a section of my web site for hams to post their request for over-the-air schedules. Included in the posting is a place to list the posters specific ham radio contact needs (countries, zones,IOTA, grid squares, LEO's ect...). The postings will also include an e-mail link that will allow hams that read the posts, to easily request an over-the-air schedule.

How Can Cyberscheds work for me?

Do you need a certain state to complete a WAS award? Are you just a few countries away from a DXCC? Are you a QRP operator looking to make contacts with hams all over the world? Are you a DX station that has grown tired of the stateside pile-ups on 20 meters? Or are you going mobile into a hard to work county?

In all the above examples you could have prearranged cyberscheds with those hams that you want to work. If band conditions are poor just e-mail the hams you could not work and set up a new schedule.

Cyberscheds are a simple way to have the internet work to the benefit of hams all over the world.

All posting will stay on-line for 6 months, or until the posting is asked to be deleted.

Visit http://www.sarrio.com and participate in your first cybersched.

Source record: 21727

August 22, 1996, at 4:15 UTC

Hello and thanks for reading this. I have suceeded in getting a set of provisional elements for JAS-2 (see the latest issue of Spacenews). Last night, I copied the CW beacon at 435.795 MHZ. Tonight, on the local AMSAT net in Denver, I heard that the transponder was open. At 3:48 UTC, I tuned in and heard a couple of SSB stations. I listened for CW stations and heard none. I called CQ a number of times and heard absolutely nothing.

I'll be on tomorrow night at 4:38 UTC when JAS-2 makes another pass over my QTH (Denver, CO., grid: DM-79). If you are into satellite CW contacts, get on the air! I'd like to make my first JAS-2 QSO before the orbit number gets into three figures!

Your AMPS phone will send the ESN and Mobile Ph no on
the reverse Forward control channel (FCC)of the local cell
site(around 825MHz), the signal can be recieved and decoded if the
monitoring radio is in range.

Most people are changing over to GSM digital phones over here
this fixes the hacker problem.

In article <4vdul7$ke1@newsbf02.news.aol.com>, philbada@aol.com (PhilBada) says:
>
>How in the heck did these criminals clone my cellular phone last week???
>Any electronics whizzes out there want to enlighten me... I am guessing
>some form of frequency counter???
>
>Phil
>N8QDK

For about $1000.00 you can purchase an ESN reader that attaches to a scanner.
Stand on a street corner with one of these and record each ESN as
the vechile passes you.
For another $1000 to 2000.00 ypu can purchase programming software for
cellular phones.

You now have a valid ESN and a way to place it into another cellular
phone. Is this legal? No! But that does not stop a lot of people.

Pick up a copy of Nuts and Volts. You will be suprise as to what you can
purchase.

Not a good feeling to have a phone duplicated. The technology is ther
to build the phone and the same technology can duplicate it.

ALUCINA

Traduccion libre ingles-espa&#65533;ol EA5XE

Escribe Sandy (WA6BXH / 7J1AEB).

Recientemente he recibido una carta de un viejo amigo, Joe Speroni (AH0A / 7J1AAA), que ha vivido y trabajado en Jap&#65533;n durante muchos a&#65533;os. Es tambi&#65533;n el autor del software de la Academia de Morse, famoso programa para ense&#65533;ar esta modalidad. Es una carta tan excitante que he pensado seria muy interesante conocerla para otros muchos, as&#65533; que os la mando integramente. Esta es la carta:

Estimada Sandy:

Hab&#65533;a prometido una serie de art&#65533;culos a la revista de la asociaci&#65533;n de radioaficionados japoneses, pero hay algo aqu&#65533; mas excitante que no puede esperar mas a ser contado. Me tomar&#65533; pues un descanso y hablar&#65533; de ello.

Todo comenz&#65533; con el trabajo que Ed Coan (AH6MI / 7J1AAE) hacia en su ordenador, calculando y dibujando una antena para los locales de la asociaci&#65533;n de radioaficionados de Tiara. Coan realizaba el proyecto seg&#65533;n las necesidades que los del radioclub le hab &#65533;an pedido, sabiendo que una buena estaci&#65533;n necesita una buena antena. La antena de Ed parec&#65533;a que iba a resultar muy grande y los resultados del ordenador as&#65533; lo confirmaron. Los contactos regulares entre Colorado y Maine no pueden ahora basarse en la pro pagaci&#65533;n, pues las manchas solares est&#65533;n bajo m&#65533;nimos.

Mi mini-antena no puede compararsele y me permit&#65533; una reflexi&#65533;n sobre lo que podemos hacer los que vivimos en peque&#65533;os apartamentos, donde el espacio es el principal problema. &#65533;Como poner el largo hilo de una antena en un balc&#65533;n? La soluci&#65533;n son las bobina s de carga y el problema, al mismo tiempo, que la resistencia a la radiaci&#65533;n del hilo se sustituye por una reactancia. Cuantas mas vueltas tienen las bobinas mas se disipa la potencia, en vez de radiarse. Si la antena no dispersase la potencia radiada.....

Hmmmmm ... dejame ver, P = E x E x R, Si R fuese 0, entonces .....

Por mi trabajo, tengo contacto con algunos grupos de investigaci&#65533;n de la Universidad de Tokio. Mejor todav&#65533;a, supe de un radioaficionado japon&#65533;s que se gradu&#65533; alli. De mi cabeza no se separaba el pensamiento de construir un super-conductor para usarlo en una antena. Esto

requiere temperaturas criogenicas, por ejemplo de 279 grados bajo cero.

Los universitarios se interesaron en el proyecto y nos pusimos a construir una direccional para 10 metros de muchos elementos y peque&#65533;as dimensiones. A base de bobinas de carga para cada elemento lograr&#65533;amos la resonancia y as&#65533; quer&#65533;amos construir una mini antena hecha de un superconductor. Baj&#65533; mi tranceiber TS-940 al laboratorio para las primeras pruebas, pero mostraron que resonaba en 31.260 Khz.

Parece que las ecuaciones para una inductancia normal, no trabajan lo mismo a bajas temperaturas, donde se n ecesita dar unas vueltas menos a las inductancias. Muchas medidas y ensayos mas tarde, ten&#65533;amos una antena resonante en diez metros. Tenia 320 elementos en menos de un cubo de 15 cms.

La primera prueba no fue demasiado bien. Conect&#65533; el TS-930 a la antena superconductora y lo sintonic&#65533; en 10 metros. A la temperatura ambiental no o&#65533;amos nada. Usando una bomba de calor, los t&#65533;cnicos del laboratorio comenzaron a bajar la temperatura hacia l a zona de la superconductividad. Yo estaba pensando en lo peque&#65533;o que era mi equipo y como encajaba todo en el equipo del laboratorio. Entonces, el TS-930, helado dej&#65533; de funcionar. El fr&#65533;o le afect&#65533;, ten&#65533;amos que inventar algo para conectar la antena al e quipo sin que pasara el fr&#65533;o. Quiz&#65533;s un acoplamiento inductivo o alg&#65533;n material cer&#65533;mico que dejase pasar la radiofrecuencia y no el calor. Probablemente Kiocera inventar&#65533;a algo para solucionar ese problema.

Llev&#65533; el TS-940 a reparar a una tienda para radioaficionados de

Akihabara. Suzuki-san, el empleado del servicio t&#65533;cnico de la tienda, pregunt&#65533; por el motivo exacto por el que se hab&#65533;a pelado la pintura alrededor del conector coaxial. &#65533;Un rayo quiz&#65533;s?. No, le respond&#65533;, solo la exposici&#65533;n a unas bajas temperaturas, le contest&#65533;, sin especificar cuanto de bajas eran estas. El proyecto tenia que quedar en secreto, adem&#65533;s Suzuki-san tiene fama de poderlo arreglar todo. De todas formas y mientras se arreglaba el TS-930, adquir&#65533; un TS-940.

Adem&#65533;s yo hab&#65533;a ya encargado tambi&#65533;n un FT-1000.

Una vez en el laboratorio y tras comprobar que la antena superconductora resonaba en la banda de 10 metros, conectamos el TS-940.

El material cer&#65533;mico (que un&#65533;a la antena con el equipo) funcionaron bien y empezamos el ciclo de enfriamiento. La banda parec&#65533;a muerta y lo mismo cuando llegamos a los 150 grados bajo cero. Nos cost&#65533; otros 10 minutos llegar a la zona de fr&#65533;o en que el mate rial de la antena comienza a ser superconductor. Entonces el TS-940 explot&#65533;.
Parece que nuestra antena tenia mas ganancia de la que el TS-940 pod&#65533;a soportar. Mas tarde y con 100 dB de atenuaci&#65533;n, las medidas demostraron que aun llegaban 5 voltios al conector de antena del

equipo.

Algo dif�cil de creer, pero entonces �que pasar�a de poderse construir antenas superconductoras a temperatura ambiente?.
El TS-940 volvi� a la tienda de Suzuki-sam, pero en cuanto este frunci� el entrecejo le dije "ahora si que le ha ca�do un rayo". No se preocupe, me contest�, Suzuki-sam puede arreglar cualquier cosa.
El FT-1000 lleg� justo a tiempo de poder continuar los experimentos.
Construimos un QSK (atenuador) para proteger el receptor y desde el mismo laboratorio decidimos probar a ver si pod�amos hacer un contacto en diez metros.

Chico, que sorpresa cuando lo pusimos en funcionamiento. Lo primero que o�mos fue a dos W2's haciendo un qso local (Nota de EA5XE.- W2 es Estados Unidos, y ellos estaban en el Jap�n), y est�bamos con el atenuador en 80 decibelios.

Nosotros pod�amos rotar la antena, as� que la mov� un grado y los W2 desaparecieron. �Que anchura de banda!. Los sintonizamos de nuevo y estaban a punto de despedirse as� que pensamos que tratar�amos de trabajarlos.

El equipo estaba ajustado sobre una carga artificial para sacar 50 watios. Cambiamos a la antena superconductora y N2BA hizo una llamada.
El ruido fue incre�ble. Un rayo ioniz� el aire desde la antena hasta la pared del laboratorio. Hab�a un agujero en la pared de 1 cent�metro de circunferencia. Cortamos la transmisi�n r�pidamente.
N2BA volvi� a escuchar unos minutos despu�s pero no escuch� nada. Por alguna raz�n la estaci�n que hablaba nunca volvi�, as� que decidimos no transmitir de nuevo hasta estar seguros de que est�bamos haciendo.
Aproximadamente podemos decir que la antena tiene 120 de ganancia, pero que con una desviaci�n de 0,75 grados, esta cae a 60 db.
Es decir, que con 50 watios a la salida del equipo, estos se transforman a la punta de la antena en 5,5 cuatrillones de watios: 5.500.000.000.000.000 watios.

En cuanto la Universidad se dio cuenta de lo que hab�amos construido, se llev� el proyecto entero lejos de nosotros y lo cedi� a las Fuerzas A�reas Japonesas.

Luego que digan que los radioaficionados se "ocupan vanamente" o "contribuyen con algo, pero no se sabe exactamente con que".
No tengo ni la mas ligera idea del material con el que estaba construida la antena ni podr�a explicar como construir otra. Pero me gustar�a poderla usar en el pr�ximo contest mundial.

�Piensa alguien si esto podr�a interesar por ejemplo a proyectos como el de la Guerra de las Galaxias?.

Unos meses mas tarde la Universidad se puso en contacto con nosotros y pregunt� como se comportaba la antena cuando la probamos.
Parece ser que una utilidad secundaria de nuestra antena seria la de

esterilizar las masas, pero la confirmaci�n de esto tendr� que esperar a las pruebas m�dicas. Si una antena aunque solamente fuese remotamente parecida a la nuestra, saliese al mercado, seria una maravilla.

Cuando escribo esto, Suzuki-san me ha dicho que no puede arreglarlo todo a pesar de su fama, y que puede ser que Yaesu anuncie nuevos modelos pronto.

Yes, as the title said..."rg-11 or 9913"
i need to run 150ft of cable, but here is my question:
which has less loss for a 150ft run...
at 3.7-4.2 GHz with 9913
or .95 - 1.45GHz with rg-11 <or rg-6??>

thanks

```

It can't. Pre-arranged contacts are not good towards any sort of award or certificate, so this particular piece of cyber-technology won't be much use to anyone. Of course, you could use it anyway, and just cheat...

Both will have lower loss at 0.95-1.45 GHz. You need to use a coaxial cable with the correct characteristic impedance. R-11 and RG-6 are 75 ohn cables and 9913 is a 50 ohm cable. The impedance should match your equipment. Times LMR-400 is an even better cable than Belden 9913 and is about the same price. The 9913 uses air dielectric. The center conductor can corrode quite easily and can be displaced when the cable is bent. Either increases attenuation. LMR-400 uses a very low loss foam dielectric than protects the center conductor. It is also much lighter as it uses copper plated aluminum.

yeah, when they work they're grand. but there seems to be little if any rechecking to see if a url on file at a search location is really there - so you might get 1 of a million possible listings with about 999,000 of them unusuable at all.

of course, there's one location where you have to download files (getting a catalog), expand, run an installation program on the data, then you find you have a bunch of directories and a ton of HTML files to pull up in the browser to view 'em...(now, THAT'S comedy). <sigh>

My guess is ROT13 is short for ROTATE 13. If you imagine the alphabet on a
wheel, you would cipher the text by rotating the wheel 13 spaces

By goom, you're right! I did it the hard way - I noticed Ken Harker had capitalized a V in the middle of one of his sentences. I assumed this was "I" (what other single letter do we capitalize?) and translated (rotated) the alphabet accordingly. Everything fell out nicely from there.

After deciphering "If you can read this, you really ought to get out more," I decided the effort greatly outweighed the rewards!

Hi I have this idea about a client/server system where by there would be a sat tracker client and a server element database. The client would access the element database through the internet using TCP/IP. So that the client element database would always be up-to-date. All of the tracking calculations would be up to the client. The server would only handle DB requests.

My 2 cents worth,
Benjamin K. Derry

FOR IMMEDIATE RELEASE Jack Moore
1-800-545-4021 (505) 437-2840

SPACE CENTER LAUNCHES INTO CYBERSPACE

ALAMOGORDO, N.M. - The Space Center in Alamogordo, a division of the New Mexico Office of Cultural Affairs, now has an extensive presence in cyberspace. There are now two World Wide Web sites from which to access information about the International Space Hall of Fame, the Clyde W. Tombaugh Omnimax Theater and Planetarium, the John P. Stapp Air and Space Park, and the many other elements that make up New Mexico's internationally-recognized space museum.

One web site was the result of a lot of hard work by members of the Alamogordo Consortium, who designed the pages, and Wazoo Computers. Wazoo Computers of Alamogordo is providing the free home for the web pages.

The pages offer text and photographs that tell the story of the history of space research in New Mexico, what's showing at the Tombaugh Theater, hours of operation, admission prices and special events. The site can be found on the InterNet at the following web address: http://www.wazoo.com/~alamo/space/index.html. Sign the guest book while you're there.

The second site came as the result of cooperation between the Space Center and New Mexico State University-Alamogordo. The web pages were designed by Space Center Program Manager Bob Wood, who also is a computer science and electronics instructor at NMSU-A. It was the first time Wood had ever attempted such a project. He worked into the wee small hours of many mornings crafting the web pages and then loading them into NMSU-A's server.

The NMSU-A site also details much of the history of space in New Mexico (the Land of Enchantment is the birthplace of America's space program) as well as information about International Space Hall of Fame inductees, the Governor's Space Center Commission, and links to other space-related World Wide Web sites. The NMSU-A site can be accessed at: http://abcc.nmsu.edu/~bwood/.

If you have access to the WWW, you'll want to visit both sites. They're quite informative.

Jeff, you're using the built-in newsreader in the Netcruiser software.
It's crap. Try using Free Agent -- and, if you like it, you can buy
Agent -- and you can do ROT13 with a couple of mouse clicks. Much
more importantly, you can also do most of your Usenet news stuff
offline.

The reason for rot13 is not to encrypt a file to keep unwanted recipients
from seeing it. It's just a way someone can post something which can't
be read accidentally. Like posting a joke which someone might find
offensive to a humor group. If someone is just rifling thru the jokes
they won't be offended unless they deliberately decode the rot13.
Another use might be for a post which "spoils" or gives away the plot of
a book or movie.

c002@Lehigh.EDU wrote:
: Yes, as the title said..."rg-11 or 9913"
: i need to run 150ft of cable, but here is my question:
: which has less loss for a 150ft run...
: at 3.7-4.2 GHz with 9913
: or .95 - 1.45GHz with rg-11 <or rg-6??>

Well, aside from the impedance/freq differences, the chart on the wall says:
(length adjusted)

4.0 GHz w/9913 ~16db loss
1.2 GHz w/RG11 ~12db loss

db/100' loss:
1GHz 3GHz 5GHz
RG6A 9.8 23.0 32.0
RG11 7.8 16.5 26.5
9913 4.5 N/A 13.0

LDF5-50 1.4 2.5 3.5 (preamp is cheaper :)

Sounds like you need a downconverter and pre-amp before you stuff it through
150' of coax. And don't forget to add connector loss in there too.

The most current orbital elements from the NORAD two-line element sets are carried on the *NEW* Celestial WWW,

http://www.grove.net/~tkelso/

and are updated daily (when possible). Documentation and tracking software are also available on this system.

Element sets (also updated daily) and some documentation and software are available via anonymous ftp from archive.afit.af.mil (129.92.1.66) in the directory pub/space.

As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space.news and rec.radio.amateur.space. This week's elements are provided below.

Try 137.5MHz and 137.620MHz. The wxsats "broadcast" in FM and the
bw is about 50KHz. A NFM scanner will allow to listen, but not
to receive and display an image. When a wxsat is at a higher elevation
you can hear them on a handheld scanner with the rubber duckie antenna.
Serious recpetion is a bit tougher.

It seems the best solution would be to place up-to-date resource files
on the SatTrack web page. We'll make a 'User Resources' entry and provide
some updated resource files there. Just give us a day...

The new SatTrack web page can be found at:

http://www.bester.com/sattrack.html

This page contains the latest patches for version 3.1 and a description
of our new product SatTrack V4.0.

Yeah, Tony, I've had days like that. I always figured I
ought to wait til I got a manager who was a little shrimp
of a guy before I decided to "been" one of them.

Heck, just file a grievance. It'll drive him nuts!

1646. mir no rx

Newsgroup: rec.radio.amateur.space
Date: 1996-08-27 00:00:00 UTC
From: Jeff Griffin <griffinj@admin.tc.faa.gov>
Message-ID: <4vvgljINN1t3@faatcrl.faa.gov>
Source record: 21624

I was building a Lindenblad antenna system for sat work
(lhcp and rhcp), and was using the recorded message on 437.925
to check my progress. This signal seems to be off the air. Has
anyone had any luck in the last two days with Mir? The freqs
I'm using are 437.950 and 437.925 the 950 is the repeater
output, but I have heard nothing on that either. Is there any
70cm sat freqs that are more reliable I have FM and paket.
Thanks in advance for any info.

Its the Progress M-32 that was docked a couple weeks ago. It was removed to
make way for the Soyuz with the Mir-22 crew. The Progress is parked and
will be
redocked after the Mir-21 crew leaves.

1649. 'modes.dat' for 'SatTrack'

Newsgroup: rec.radio.amateur.space
Date: 1996-08-27 00:00:00 UTC
From: Tovar <tvr@alive.com>
Message-ID: <322252A2.167E@alive.com>
Source record: 21766

Can someone suggest where/how i can get a current version of 'modes.dat' (which contains frequencies and modes of operation), including, for example, JAS-2? It seems like a real waste to get the whole SatTrack package just to get that one file. Or, did i miss something and there's some easy way of getting that?

: Jeff, you're using the built-in newsreader in the Netcruiser software.
: It's crap. Try using Free Agent -- and, if you like it, you can buy
: Agent -- and you can do ROT13 with a couple of mouse clicks. Much
: more importantly, you can also do most of your Usenet news stuff
: offline.

Or, if you use 'tin' as the newsreader, you can do so by simply pressing
a lower case d key while in read mode.

A friend of mine is a radio amateur and he has got this transceiver
radio:
RTX mark ALINCO
ELECTRONICS INC. JAPAN
Portable VHF
model DJ180E

He has got two questions about this radio:
1) How can he modify his radio to extend the band from 144/146 MHz to
130/170 MHz?
2) Can he receive the "manual for use" of this radio? (A photocopy of
the manual is acceptable too!)

For details, please conctact me through my personal e-mail address.
Thank you very much!

1656. "New" Amateur Satellite Project

Newsgroup: rec.radio.amateur.space
Date: 1996-08-29 00:00:00 UTC
From: lindley@syd.dit.csiro.au
Message-ID: <5031e6$hak_001@syd.dit.csiro.au>
Source record: 21629

The Australian Space Research Institute (a non-profit
space R&D group in Australia) is currently working on
a microsatellite project.

This project has been going for several years at a
pretty slow rate of progress, primarily due to lack
of funding opportunities here in Australia. Despite that,
some progress has been made in developing the overall
system design, with detailed studies completed, and some
fabrication completed on the spacecraft structure. Most
of this work has been done as university student projects.

Due to a significant change in the local situation, with
healthier possibilities for contributions and grants, we
are considering ramping up this development effort.

We have previously discussed the possibility of acquiring
the AMSAT-NA microsat plans, but could not obtain sufficient
funding to purchase them from AMSAT-NA (ie. $US15 000).

Does anyone know of any additional sources of this kind
of detailed technical information? We can continue to
do this alone, but it would be nice to have the opportunity
to discover pitfalls before we attempt to build something
(and especially before we attempt to launch it!).

Any help will be greatly appreciated.

regards, Craig Lindley

Hi Brian,

Thats great that you were able to watch the MIR pass over, looks neet huh? A couple years ago while I was driving my semi in the mountains near Sisters Oregon, remembering that a visible pass of the space shuttle was that morning, I pulled the semi over to the side of the road, fired up the 2m and called for W5RRR, I was shocked to see AND hear the shuttle coming over the horizon, I had about a minute qso with the shuttle before they moved onto another station. They said that I was (to their knowledge) the only "semi mobile" to make a contact on that mission! It was truely kewl to see them go over my head while I was talking to a crew member at the same time. I'll cherrish that morning in my memory for a long time.

Anyway, to answer your question, SAC is currently tracking tens of thousands of space "things".. From the smallest of lost bolts, to highly top-secret sat's. It is very likely that you were observing one of these "unlisted" sat's.

Take care and 73's

John KB7VZL

Alex wrote that he was looking for a nice program
for the Commodore C-64 that tracked satellites, called
VR85.

The program is reviewed in 'The Beginners Column' of
Satellite Times May/June issue (Vol 2, No. 5).

It can be obtained by sending $20.00 (postage paid) to
RLD Research,
Box 888,
McCloud,
CA 96057.

You can add the elements (available from this newsgroup
or from http://www.grove.net/~tkelso) and it can handle
20 satellites. Its very slow, but works well, according to
the article.

Good luck.

1662. MIR PRIRODA module status

Newsgroup: rec.radio.amateur.space
Date: 1996-08-29 00:00:00 UTC
From: Tovar <tvr@alive.com>
Message-ID: <3225FCC4.41C6@alive.com>
Source record: 21635

I asked on the local AMSAT net in the S.F. Bay Area and no one has heard MIR on the 70cm side in several weeks. Voice QSO have been heard on the 2 meter side, and we did hear packet on 145.55 two evenings ago, but neither person was setup to decode AX.25 at the time. So, while the two observers were probably about 50 Km apart, we don't know if the signals were terrestrial or from MIR, as propagation the Bay Area can be interesting at times...

If anyone knows the MIR status, I would appreciate a report, so i can know when to try again with antenna experimentation.

A trip to my home page reveals there are many good files and programs for amateur radio operators that want to use Mac computers.

<http://www.mv.com/ipusers/wd1v/>

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Roster - a virtual "Whos Who" HyperCard stack with more than 700 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and their passions and put a design on your Mac Radio future when you see what neat things are being done!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can get with just a click.

* Ham Radio.FAQ - compiled on a Mac with a lot of links to great Mac FTP sites for radio, electronic engineering, and similar data.

Sorry, but should surly think that if it was something large enough
to see, and something that was that close to the MIR that it would be
listed. As was said before, it was M-32. A well "Listed" sat....

Check out SatTrack v3.1. It offers real-time tracking of
over 500 satellites, text and X graphics displays of single
or multiple satellites. It can also control antennas and
radios. Neat stuff, IMHO.

Agreed! Fading and timing are also relevant, and both observers
were not willing to say that it was definitely Mir, but might be.
It's not also that either observer couldn't determine where the
signal was coming from, but rather that, at least in my case, this
was a background task and at the time, this was considered less
important than the foreground task to determine the source of the
signals.

The point of the posting was to inquire about the 70 cm side, that
is, has anyone heard Mir on 70 cm in the past several weeks, or know
why not?

Try 137.5MHz and 137.620MHz. The wxsats "broadcast" in FM and the
bw is about 50KHz. A NFM scanner will allow to listen, but not
to receive and display an image. When a wxsat is at a higher elevation
you can hear them on a handheld scanner with the rubber duckie antenna.
Serious recpetion is a bit tougher.

Hi Richard,

Both of the satellites you mention have some problems. AO-13 has been at a poor attitude of late for the northern hemisphere. This is being changed today. It should be stronger soon. Work this one while you can. It will be re entering the lower atmosphere in November/December and will be gone.

AO-10 has been "brain dead" for several years. Radiation above the Van Allen Belts has damaged the onboard computer to the point that the bird is no longer under control. The batteries have also gone away. It is possible to use AO-10 when it is in sunlight in fact sometimes it is very good.

You must remember that these satellites are not LEOs and so are truly weak signal stations. The advantage of them is the Doppler is much more stable so you don't have to talk and tune at the same time.

I hope this helps you understand why you receive weak signals from these birds. For more info point your web browser to amsat.org they have a bunch of stuff including timely stuff on the demise of AO-13.

1681. Help: re pacsats

Newsgroup: rec.radio.amateur.space
Date: 1996-09-02 00:00:00 UTC
From: kenn2sqw@aol.com
Message-ID: <50fv4m$9fv@newsbf02.news.aol.com>
Source record: 21654

I've been involved with the analog sats for over a year now, and am thinking of trying the digital birds next. What suggestions do you have regarding a relatively inexpensive way to get on the pacsats? I'm using a Yaesu FT736R transceiver for the sats. I have a typical terrestrial packet setup, so I'm familiar with packet from that point of view.
Thanks, and 73, Ken

Please reply either here, or preferably, via E-Mail.

Hello, Stephen:

Take a look at my Home Page at:

http://www.trucom.com/ppages/marty

I have a Ham Radio and Amateur Astronomy area where the Astronomy area
focuses on Amateur Radio Astronomy.

Take Care & 73

CENTRAL INDIANA REPEATER/ATV/GPS PACKET BALLOON LAUNCH

Region: Central Indiana

Date/Time: Saturday, September 7 / 7:00-8:00 AM EDT,
11:00-12:00 UTC

Location: Greentown, Indiana (8 miles east
of Kokomo)

Other states where
the signals will
reach easily: Ohio, Illinois, Michigan, Kentucky

Site Coordinates: approximate for initial antenna heading;
(not for navigating to launch site)
40' 29" North Lat.
85' 58" West Long.

ATV: 439.25 MHz AM NTSC from live camera

VHF/UHF Repeater: Input - 144.30 MHz FM
Dual Output - 444.85 MHz FM
- 52.525 MHz FM

Telemetry: 446.00 MHz FM AX.25 1200 baud packet
GPS/APRS position data

HF Net: 3.869 - 3.871 Mhz SSB

Local repeater
talk-in: probably 146.91 or 147.24

---
launch data courtesy of Malcolm Mallette, WA9BVS
malletem@trader.com

Please email me news of upcoming balloon launches and post-flight
reports for distribution on the Net.

Subject: Mac Sat Software

A trip to my home page reveals there are many good files and programs for
amateur radio operators that want to use Mac computers.

<http://www.mv.com/ipusers/wd1v/>

* Ham Radio Test Simulators - where you can go from Novice to Extra Class
practicing the actual tests right on your Mac! Check out the info on the
new NO CODE license or scramble your neurons and learn Morse on the Mac
too!

* Macnet Roster - a virtual "Whos Who" HyperCard stack with more than 700
entries giving the names, addresses, phone numbers, of radio operators
all over the world that are using Macs. Check out their projects and
their passions and put a design on your Mac Radio future when you see
what neat things are being done!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of
the latest - much of it with FTP links so what you see is what you can
get with just a click.

* Ham Radio.FAQ - compiled on a Mac with a lot of links to great Mac FTP
sites for radio, electronic engineering, and similar data.

It is quite easy to determine if a signal is from Mir. Watch the
frequency of the transmission. For a space signal you will observe
a phenomenon called doppler shift: the signal will start out on a
higher frequency than specified, and it will become lower and lower
during the pass. On 2 metres the difference will be 3-4 KHz, so it
should be easily observable. On 70 cm it is about 10 KHz, so it is
enough to miss the signal when you are not prepared.

Tracking: SatTrack. http://www.primenet.com/~bester/sattrack.html

Communication: there is a program for X but I can't remember the location.
Look in the Hamradio HOWTO.

Sorry, but should surly think that if it was something large enough
to see, and something that was that close to the MIR that it would be
listed. As was said before, it was M-32. A well "Listed" sat....

Try 137.5MHz and 137.620MHz. The wxsats "broadcast" in FM and the
bw is about 50KHz. A NFM scanner will allow to listen, but not
to receive and display an image. When a wxsat is at a higher elevation
you can hear them on a handheld scanner with the rubber duckie antenna.
Serious recpetion is a bit tougher.

Could you please tell me how to receive the video? Is it a TV-UHF frequency? I have an old Rabbit receiver, but don't know what frequency it's on....

You can receive ATV the following ways:

Using an ATV down converter (converts 439.25 to TV channel 3) and a
70cm Beam Antenna

Using an old TV or VCR with manual tuning hooked up to an outside
antenna.
You will have to tune the TV to UHF channel 14 and then try using
your
fine tuning control and tune DOWN. The ATV frequency is BELOW
UHF ch 14.

Using a newer TV or VCR that is cable-ready. Hook the TV or VCR up
to an
outside antenna and then set it for CABLE CHANNEL 60.

The first method is BY FAR the best. Down converters are around $80 and
you can
make your own beam (I did). Make sure your receiving antenna has the
same
polarity as the transmitter. Cross polorization loss on 70cm can be as
much
as 20db.

From: h1riley@umassd.edu (Hank Riley)
Subject: Indiana repeater/ATV/Packet APRS Balloon Launch
Organization: UMass Dartmouth, N. Dartmouth, MA.

CENTRAL INDIANA REPEATER/ATV/GPS PACKET BALLOON LAUNCH

Region: Central Indiana

Date/Time: Saturday, September 7 / 7:00-8:00 AM EDT,
11:00-12:00 UTC

Location: Greentown, Indiana (8 miles east
of Kokomo)

Other states where
the signals will
reach easily: Ohio, Illinois, Michigan, Kentucky

Site Coordinates: approximate for initial antenna heading;
(not for navigating to launch site)
40' 29" North Lat.
85' 58" West Long.

ATV: 439.25 MHz AM NTSC from live camera

VHF/UHF Repeater: Input - 144.30 MHz FM
Dual Output - 444.85 MHz FM
- 52.525 MHz FM

Telemetry: 446.00 MHz FM AX.25 1200 baud packet
GPS/APRS position data

HF Net: 3.869 - 3.871 Mhz SSB

Local repeater
talk-in: probably 146.91 or 147.24

Mean Sporadic activity of long duration reflections > 1 sec, starting at UT:

10h 11 12 13 14 | 18 19 20 21 22 23 0 1 2-2.5
---
2 2 2 2 3 | 4 4 2 6 5 4 7 6 6

Dead time corrected counts of reflections during one hour intervals.
Between brackets the number of long duration reflections > 1 sec,
starting at UT:

August 11 August 12
18h 19 20 21 22 23 0 1 2-2.5

115(19) 127(12) 169(20) 216(24) 188(16) 271(36) 281(52) 320(70) 116(25)

August 12
10h 11 12 13 14

106(18) 180(21) 138(26) 130(16) 114(10)

. very high activity between Aug 11 23h UT and Aug 12 2h UT.

E.P. Bus

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.41 Siedlce Poland 39 04h57(Sun05h57)-02h00(Sat03h00)
66.47 Viesintos Lithuania 12 05h00-22h00
66.50 Sofia Bulgaria 10 24hrs
66.56 Poznan Poland 56 04h57(Sun05h57)-02h00(Sat03h00)
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 06h00-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 o (= East),
elevation 27 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB

Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

August 1996

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:

. local time = UT + 2 hours.
. % direct reception
. ? high count to be checked for potential sporadic E.

Maurice De Meyere

Observer: Werfried Kuneth
Location: Villach, Austria (13 53' E, 46 37' N)
Antenna: dipole with reflector
Receiver: AR-8000 at 59.2505 MHz, SSB mode,
Narrow passband filter, no preamplifier.
Transmitter: 150 kW TV video carrier in Bucaresti,
Romania, distance 950 km, east direction.
Observing method: the audio signal is fed into a real time FFT display
(FFTDSP38 program from AF9Y) on the PC where 640 channels of 2 Hz width
are recorded and stored continuously. The sensitivity of each 2 Hz wide
channel is about -171 dBm. Every meteor reflection (in SSB mode)
produces a distinct whistle, which is recorded easily by the real time
FFT program and saved in .GIF pictures of 200 seconds each.
From the 1280 Hz wide received picture only one channel of 40 Hz width
is used for meteor identification, the other nearby "channels" are used
to monitor interference, which can be identified easily this way. If
any interference occurs, the whole 200 second recording of one
picture is not used for further processing.

The following figures show the total length of the meteor reflections
during one hour,expressed as percentage. The number here shows
10 times this value. (e.g. 100 means 10 percent).

Notes:
. blank value means either no data available, interference,
sporadic "E", power failure, shutdown during thunderstorms or
transmitter shutdown.
. local time conversion: 2 hours ahead of UT (06h00 UT is 08h00 local).

. maximum Perseid activity during the early hours (UT) of Aug 12.

. *** Radio Meteor Gallery is open ***
I'd like to invite you all to my new Radio Meteor Gallery,
with the best spectrograph pictures out of about one million
recorded meteor reflections during last year. URL is
<http://www.net4you.co.at/user/kuneth/gallery.html>

Werfried Kuneth

Observer: Kimio Maegawa
Transmitter: 50 W CW 53.7500 MHz
Transmitter antenna: 2 element Cross Yagi 4dBi, zenith
Transmitting Location: Sabae city (136 11' E, 35 56' N)
Receiver: IC726 500 Hz BW , sensitivity -154 dBm min
Receiver antenna: 3el Yagi 7 dBi (70 deg, SE direction) height 10 m
Receiving Location: Ohno city (136 53' E, 36 00' N)
Data processing : Receiver output is fed into DX2-66 MHz PC and analyzed by
AF9Y's FFTDSP42 software.
Then stored every 4.22 min automaticaly with GIF format.
Play back GIF files and count echoes manually by the doppler
shift rejecting tropo signal or airplane echo.

Long duration echoes (t>2 sec):

| August 1996

---+---------+---------+---------+---------+---------+-------
UT | 8/ 9 9/10 10/11 11/12 12/13 13/14
| August 1996
```

Notes:
. local time = JST = UTC + 9 hours
. the radiant was not located favorably when the Perseids maximum occurred: yet a significant relative increase (with respect to the adjacent days) is seen between 0h-2h UT on August 12.

Kimio Maegawa

Observer: Ton Schoenmaker
Location: Roden, Netherlands (6 degr 26' E, 53 degr 08' N)
Frequency: 66.89 MHz
Transmitter location:
Krakow, Poland, 120 kW, distance 980 km
Antenna: Horizontal Yagi, 5 elements, geographical azimuth 110 degrees (ESE), elevation 15 degrees
Receiver: Homemade convertor 65-67 MHz to 28-30 MHz + Barlow-Wadley 0-30 MHz receiver; total sensitivity 0.3 uV for 20 dB S/N with a bandwidth of 3 kHz
Observing method: Brown strip chart recorder, 9 or 18 inch/hour + occasional listening.

Dead time corrected counts of reflections during one hour intervals starting at:

```

Notes:

- @nn =corrected hourly rates (observed for less than 60 min).

- local time = JST = UT + 9 hours.

Kazuhiro Suzuki

Observer: Ilkka Yrjola
Location: Finland (26 35' E, 60 54' N)
Frequency: 87.360 MHz
Receiver: Salora SRP-22 modified, narrow band FM (B=15 kHz).
detected signal level >-122 dBm.
FM detection, no pulse noise rejection required.
Antenna: 2 element Yagi with 4 dBd gain to SW, azimuth: 45 o (SW)
Data sampling system: threshold triggering, sampling rate 64 ms.
Computer logs total hourly elapsed reflection time, number of
threshold crossings for the hour, the longest time the signal was
continuously above detection level for the hour.
Data stored in the Compact MS-Soft format. Software for viewing available
from FTP.FUNET.FI pub/ham/vhf-work/mssoft43.zip (new version!)

Try 137.5MHz and 137.620MHz. The wxsats "broadcast" in FM and the
bw is about 50KHz. A NFM scanner will allow to listen, but not
to receive and display an image. When a wxsat is at a higher elevation
you can hear them on a handheld scanner with the rubber duckie antenna.
Serious recpetion is a bit tougher.

Agreed! Fading and timing are also relevant, and both observers
were not willing to say that it was definitely Mir, but might be.
It's not also that either observer couldn't determine where the
signal was coming from, but rather that, at least in my case, this
was a background task and at the time, this was considered less
important than the foreground task to determine the source of the
signals.

The point of the posting was to inquire about the 70 cm side, that
is, has anyone heard Mir on 70 cm in the past several weeks, or know
why not?

Check out SatTrack v3.1. It offers real-time tracking of
over 500 satellites, text and X graphics displays of single
or multiple satellites. It can also control antennas and
radios. Neat stuff, IMHO.

Duh, forgot to tell you where to get it!
It's available from AMSAT http://128.54.16.15.
They also have other programs broken down into
groups based on operating systems, so they also have
other Linux software

Subject: Radio Astronomy

Hi uk.radio.amateur!
Help required, does anybody have a current
contact address for "BARAS" British Amateur Radio Astonomy Society. And can
anybody help with info and advice on setting up a radio telescope to
monitor solar emisionns. Any info , help or advice will be much apreciated.

The easiest way to find the satellite once you have the equipment to do so up and running is pointing in the general direction of the bird and tuning your receiver to 1.537 Ghz (1537 Mhz). This is the frequency for the US AFRTS (Armed Forces Radio and Television Service) and makes a great beacon to tweak your antenna pointing and checkout your system.

Try 137.5MHz and 137.620MHz. The wxsats "broadcast" in FM and the
bw is about 50KHz. A NFM scanner will allow to listen, but not
to receive and display an image. When a wxsat is at a higher elevation
you can hear them on a handheld scanner with the rubber duckie antenna.
Serious recpetion is a bit tougher.

Not Really! The 736 should put out 25W on 6. The older 726R put out
10W. The 736 1.2Ghz module is around 10W out.

All,

Does anyone know how much power the 6 meter module for a yaese 736 puts out. I have one, brand new, and I can't seem to get any more that about 3 watts our of it. Is this correct???

Thanks,
Alan Adamson

ps. please email to ne1h@ne1h.radio.org

You should get about 10 watts out of the 6 meter module. I have the service manual if you need any data.

Subject: Help: re pacsats

I've been involved with the analog sats for over a year now, and am
thinking of trying the digital birds next. What suggestions do you have
regarding a relatively inexpensive way to get on the pacsats? I'm using a
Yaesu FT736R transceiver for the sats. I have a typical terrestrial packet
setup, so I'm familiar with packet from that point of view.
Thanks, and 73, Ken

Please reply either here, or preferably, via E-Mail.

Hello, Stephen:

Take a look at my Home Page at:

http://www.trucom.com/ppages/marty

I have a Ham Radio and Amateur Astronomy area where the Astronomy area
focuses on Amateur Radio Astronomy.

Take Care & 73

Subject: WTB: Low Output or Dead High Power Transmitting Tubes

I want to buy dead power transmitting tubes. Tubes must not be broken or
physically damaged. I'm interested in tubes with power dissapations 250 watts
to 10,000 watts. Let me know what you have and I'll give you a quote.

Try 137.5MHz and 137.620MHz. The wxsats "broadcast" in FM and the
bw is about 50KHz. A NFM scanner will allow to listen, but not
to receive and display an image. When a wxsat is at a higher elevation
you can hear them on a handheld scanner with the rubber duckie antenna.
Serious recpetion is a bit tougher.

Hi Rolf

I have an inmarsat system running in Australia, try to listen to AFRTS on 1537Mhz NBFM, it i the same TX on all four satellites. I have heard the odd military TX, as well as heaps of fax and data traffic, and internation phone traffic...

If it's NBFM, it must be standard A INMARSAT.

Are there any decoders available for standard B or standard M, which
are digital?

Just curious, as always.

Hi.

I've got one S-Band signal generator that works fine that I will
sell for a very low price. E-mail me if you need one and want
more details.

Thanks,

Tim (lab@valuerocket.com) More M&TE --> http://www.valuerocket.com/

SB SPACE @ ARL $ARLS012
ARLS012 Shuttle rescheduled

ZCZC AS20
QST de W1AW
Space Bulletin 012 ARLS012
From ARRL Headquarters
Newington, CT September 6, 1996
To all radio amateurs

SB SPACE ARL ARLS012
ARLS012 Shuttle rescheduled

The space shuttle Atlantis has been returned to the launch pad in the wake of the threat of Hurricane Fran to central Florida. Atlantis had been moved off the pad and into the nearby vehicle assembly building as a precaution, due to the approach of the storm. NASA managers have set a new launch date of September 16 for mission STS-79, which will carry the Shuttle Amateur Radio EXperiment, or SAREX. The launch window opens at about 0854 UTC.

Three hams will be aboard Atlantis for STS-79: Jay Apt, N5QWL, Carl Walz, KC5TIE, and John Blaha, KC5TZQ. Prearranged ham radio contacts are scheduled with schools in Kansas, Ohio, and England, and with family and friends of the crew. The astronauts will also make random contacts with the amateur community as their busy schedules permit.

During the flight, the shuttle will rendezvous and dock with the Russian space station Mir, ferrying supplies, personnel, and scientific equipment to the complex 240 miles above Earth. Blaha will switch places with astronaut Shannon Lucid, who has been aboard Mir since March.

Additional SAREX information can be found on the ARRLWeb SAREX page, http://www.arrl.org/sarex/

Too bad you guys are illegal....144.3 cannot be used for a rptr input...and Im sure the guys on 52.525 OUT of your area would have liked to have known beforehand about it....(I may hear it down here in TX if conditions permit...)

Next time, PLEASE read the rules and run a crossband rptr using legal freqs... (try using 147.43 or something similar as the input....144.5 is the rptr subband lowest point...)

Chris
WB5ITT
cboone@earthlink.net

(PS did repost this on the TX HAM echo and the guys in Houston on ATV may be looking....I have been part of past S TX Balloon chase teams)

FT-736R 6-Meter Power Output

The Yaesu FT-736R (6-Meter) power output is 10 Watts. 3 watts sounds
too low. Make sure your watt meter is working corectly..

73's

Kevin, WD6DIH

>some easy way of getting that?

You can just edit it yourself, using a text editor.

Try 137.5MHz and 137.620MHz. The wxsats "broadcast" in FM and the
bw is about 50KHz. A NFM scanner will allow to listen, but not
to receive and display an image. When a wxsat is at a higher elevation
you can hear them on a handheld scanner with the rubber duckie antenna.
Serious recpetion is a bit tougher.

From: kenn2sqw@aol.com (Ken N2SQW)
Subject: Help: re pacsats

I've been involved with the analog sats for over a year now, and am
thinking of trying the digital birds next. What suggestions do you have
regarding a relatively inexpensive way to get on the pacsats? I'm using a
Yaesu FT736R transceiver for the sats. I have a typical terrestrial packet
setup, so I'm familiar with packet from that point of view.
Thanks, and 73, Ken

Please reply either here, or preferably, via E-Mail.
My E-Mail address is: KenN2SQW @ AOL.COM

Could you please tell me how to receive the video? Is it a TV-UHF frequency? I have an old Rabbit receiver, but don't know what frequency it's on....

Hello, Stephen:

Take a look at my Home Page at:

http://www.trucom.com/ppages/marty

I have a Ham Radio and Amateur Astronomy area where the Astronomy area
focuses on Amateur Radio Astronomy.

Take Care & 73

You can receive ATV the following ways:

Using an ATV down converter (converts 439.25 to TV channel 3) and a
70cm Beam Antenna

Using an old TV or VCR with manual tuning hooked up to an outside
antenna.
You will have to tune the TV to UHF channel 14 and then try using
your
fine tuning control and tune DOWN. The ATV frequency is BELOW
UHF ch 14.

Using a newer TV or VCR that is cable-ready. Hook the TV or VCR up
to an
outside antenna and then set it for CABLE CHANNEL 60.

The first method is BY FAR the best. Down converters are around $80 and
you can
make your own beam (I did). Make sure your receiving antenna has the
same
polarity as the transmitter. Cross polorization loss on 70cm can be as
much
as 20db.

Radio Meteor Observation Bulletin No. 37 September 1996

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: E.P. Bus
Location: Groningen, Netherlands (6 degr 33' E, 53 degr 13' N)
Frequency: 72.11 MHz
Transmitter Location: Wroclaw, Poland, 130 kW, Distance 740 km
Antenna: Yagi, 3 elements, geographical azimuth 106 degr (ESE),
elevation 12 degrees
Receiver: Bearcat UBC 177XLT Scanning Radio, sensitivity: 0.5 uV
Observing method: Listening

Mean dead time corrected Sporadic Radio Meteor activity between
1996 July 13 and 1996 August 5.
Between brackets the statistical error of one sigma.

Mean Sporadic activity, starting at UT:

10h 11 12 13 14

85(5) 96(9) 90(10) 93(6) 84(8)

18h 19 20 21 22 23 0 1 2-2.5

91(9) 102(8) 112(6) 130(13) 131(11) 166(19) 178(18) 180(12) 103(11)

Mean Sporadic activity of long duration reflections > 1 sec, starting at UT:

10h 11 12 13 14 | 18 19 20 21 22 23 0 1 2-2.5
---
2 2 2 2 3 | 4 4 2 6 5 4 7 6 6

Dead time corrected counts of reflections during one hour intervals.
Between brackets the number of long duration reflections > 1 sec,
starting at UT:

August 11 August 12
18h 19 20 21 22 23 0 1 2-2.5

115(19) 127(12) 169(20) 216(24) 188(16) 271(36) 281(52) 320(70) 116(25)

August 12
10h 11 12 13 14

106(18) 180(21) 138(26) 130(16) 114(10)

. very high activity between Aug 11 23h UT and Aug 12 2h UT.

E.P. Bus

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.41 Siedlce Poland 39 04h57(Sun05h57)-02h00(Sat03h00)
66.47 Viesintos Lithuania 12 05h00-22h00
66.50 Sofia Bulgaria 10 24hrs
66.56 Poznan Poland 56 04h57(Sun05h57)-02h00(Sat03h00)
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 06h00-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 o (= East),
elevation 27 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB

Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

August 1996

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

Notes:

. local time = UT + 2 hours.
. % direct reception
. ? high count to be checked for potential sporadic E.

Maurice De Meyere

Observer: Werfried Kuneth
Location: Villach, Austria (13 53' E, 46 37' N)
Antenna: dipole with reflector
Receiver: AR-8000 at 59.2505 MHz, SSB mode,
Narrow passband filter, no preamplifier.
Transmitter: 150 kW TV video carrier in Bucaresti,
Romania, distance 950 km, east direction.
Observing method: the audio signal is fed into a real time FFT display (FFTDSP38 program from AF9Y) on the PC where 640 channels of 2 Hz width are recorded and stored continuously. The sensitivity of each 2 Hz wide channel is about -171 dBm. Every meteor reflection (in SSB mode) produces a distinct whistle, which is recorded easily by the real time FFT program and saved in .GIF pictures of 200 seconds each.
From the 1280 Hz wide received picture only one channel of 40 Hz width is used for meteor identification, the other nearby "channels" are used to monitor interference, which can be identified easily this way. If any interference occurs, the whole 200 second recording of one picture is not used for further processing.

The following figures show the total length of the meteor reflections during one hour,expressed as percentage. The number here shows 10 times this value. (e.g. 100 means 10 percent).

| Aug 1996

Notes:
. blank value means either no data available, interference,
sporadic "E", power failure, shutdown during thunderstorms or
transmitter shutdown.
. local time conversion: 2 hours ahead of UT (06h00 UT is 08h00 local).

. maximum Perseid activity during the early hours (UT) of Aug 12.

. *** Radio Meteor Gallery is open ***
I'd like to invite you all to my new Radio Meteor Gallery,
with the best spectrograph pictures out of about one million
recorded meteor reflections during last year. URL is
<http://www.net4you.co.at/user/kuneth/gallery.html>

Werfried Kuneth

Observer: Kimio Maegawa
Transmitter: 50 W CW 53.7500 MHz
Transmitter antenna: 2 element Cross Yagi 4dBi, zenith
Transmitting Location: Sabae city (136 11' E, 35 56' N)
Receiver: IC726 500 Hz BW , sensitivity -154 dBm min
Receiver antenna: 3el Yagi 7 dBi (70 deg, SE direction) height 10 m
Receiving Location: Ohno city (136 53' E, 36 00' N)
Data processing : Receiver output is fed into DX2-66 MHz PC and analyzed by
AF9Y's FFTDSP42 software.
Then stored every 4.22 min automaticaly with GIF format.
Play back GIF files and count echoes manually by the doppler
shift rejecting tropo signal or airplane echo.

Long duration echoes (t>2 sec):

UT | 8/ 9 9/10 10/11 11/12 12/13 13/14
| August 1996
```

Notes:
. local time = JST = UTC + 9 hours
. the radiant was not located favorably when the Perseids maximum occurred: yet a significant relative increase (with respect to the adjacent days) is seen between 0h-2h UT on August 12.

Kimio Maegawa

Observer: Ton Schoenmaker
Location: Roden, Netherlands (6 degr 26' E, 53 degr 08' N)
Frequency: 66.89 MHz
Transmitter location:
Krakow, Poland, 120 kW, distance 980 km
Antenna: Horizontal Yagi, 5 elements, geographical azimuth 110 degrees (ESE), elevation 15 degrees
Receiver: Homemade convertor 65-67 MHz to 28-30 MHz + Barlow-Wadley 0-30 MHz receiver; total sensitivity 0.3 uV for 20 dB S/N with a bandwidth of 3 kHz
Observing method: Brown strip chart recorder, 9 or 18 inch/hour + occasional listening.

Dead time corrected counts of reflections during one hour intervals starting at:

```

```
Observer: Ilkka Yrjola
Location: Finland (26 35' E, 60 54' N)
Frequency: 87.360 MHz
Receiver: Salora SRP-22 modified, narrow band FM (B=15 kHz).
detected signal level >-122 dBm.
FM detection, no pulse noise rejection required.
Antenna: 2 element Yagi with 4 dBd gain to SW, azimuth: 45 o (SW)
Data sampling system: threshold triggering, sampling rate 64 ms.
Computer logs total hourly elapsed reflection time, number of
threshold crossings for the hour, the longest time the signal was
continuously above detection level for the hour.
Data stored in the Compact MS-Soft format. Software for viewing available
from FTP.FUNET.FI pub/ham/vhf-work/mssoft43.zip (new version!)

>
Try 137.5MHz and 137.620MHz. The wxsats "broadcast" in FM and the
bw is about 50KHz. A NFM scanner will allow to listen, but not
to receive and display an image. When a wxsat is at a higher elevation
you can hear them on a handheld scanner with the rubber duckie antenna.
Serious recpetion is a bit tougher.

AO-10 and AO-13 are "week" (weak)? It is going to depend on your station setup.
I do not have an ideal station... a 3 element 2m beam, a 6 element 440 beam, both
are fixed to point to the horizon. I CAN rotate the mast to point North, South, etc....
but I can not elevate the beams. I do have a 2m preamp which really helps in
reception! But, both Sats are "weak". From what I have read and from my limited
experience, the antennas are the key factor, even more so than on HF.
What kind of station do you have? If you let us know, maybe someone has a
similar setup and could offer further advice.

Mike

Ok, here is my latest attempt to HEAR my echo at all
9' solid dish with a 2ele Dipole 440mhz antenna (attached to the TV feed;))
100ft of 9913 at 50watts FM
yes..FM
would this setup work for a REAL eme radio like a multi-mode one?
if so, should i at least hear my echo break squelch at all with FM?
oooooor i'm I out of luck, and should forget it untill i get a multimode rig?

thanks

David -

I think that your station (as described) is quite a few db short of
being EME capable. I suggest that you work through what is called the
"link calculation" to see how strong your echo was and how strong it
will need to be for you to hear it. I suspect that you will learn many
interesting things by doing this bit of engineering.

Good luck!

Hello Mary. I have a newer FT 736. On 6 it should put out 10 watts in the FM mode. If your not getting full pwr out, carefully check all your connections and the SWR. If your SWR is high, the rig automatically "folds" back the output pwr tp protect the rig. I found that by putting an SWR/PWR meter between the rig and my amp the rig would put out full pwr. Another trick is to trim a short piece to until you get a flat SWR and full pwr. Good luck..Oh Yaesu will deny any knowledge of a problem. After much frustration, I got the real story from the designer of "TE" amps, here in sthe So Cal area. 73 Mike K6YPB

1727. Help with UoSAT-OSCAR-11 on 145.826 Mhz

Newsgroup: rec.radio.amateur.space
Date: 1996-09-07 00:00:00 UTC
From: Lawrence Wetmore <wetmorel@hal.ndhm.gtegsc.com>
Message-ID: <3231A6A3.137F@hal.ndhm.gtegsc.com>
Source record: 21600

Saw an article in SpaceNews that UoSAT-OSCAR-11 is active on 145.826 Mhz, but I have not been able to hear any activity. Would like to hear from other hams who have been successful in monitoring the ASCII data from this satellite.

Thanks, Larry WA1FRK Needham, MA

1728. Old Quiktrak question!

From: Clifford Buttschardt <cbuttsch@slonet.org>
Subject: Old Quiktrak question!

Some of you might remember how to load Keparian elements into Quiktrak (not Instant Track!) using the QK.EXE command. I would like to eliminate all the existing keps as they simply have become disorganized and hard to recall in the present maze of satellites.
Then by the use of a text editor download and reorganize these elements. I've tried simply using the insert key after eliminating the VISUAL reference to the satellite but the KEP data file retains the existing order. The DOC is very vague on this item!
Quiktrak remains one of my favorite programs. Can anyone recall how this can be accomplished? 73 Cliff Buttschardt K7RR ex W6HDO

1729. Ham Web Page

Newsgroup: rec.radio.amateur.space
Date: 1996-09-08 00:00:00 UTC
From: marty@trucom.com
Message-ID: <50tsfe$cge@thepit.trucom.com>

Hello, Folks:

I have just put up my new home page and invite all to drop in for a look. Included at the site are the following areas:

Ham Radio -- Mostly packet, mostly high speed

Pipe Smokers -- Very, very much still under construction

Astronomy -- Mostly Amateur Radio Astronomy (good 2nd interest for Hams!)

Mapping -- Mostly about elevation maps

Heartland Internet Services -- Lots of Web Presence information

The URL to use is:

http://www.trucom.com/ppages/marty

Thanks!

Take Care & 73

Marty Albert - marty@trucom.com
Amateur Radio: KC6UFM@KC6UFM.#SEMO.MO.USA.NOAM

Try 137.5MHz and 137.620MHz. The wxsats "broadcast" in FM and the
bw is about 50KHz. A NFM scanner will allow to listen, but not
to receive and display an image. When a wxsat is at a higher elevation
you can hear them on a handheld scanner with the rubber duckie antenna.
Serious recpetion is a bit tougher.

You can receive ATV the following ways:

Using an ATV down converter (converts 439.25 to TV channel 3) and a
70cm Beam Antenna

Using an old TV or VCR with manual tuning hooked up to an outside
antenna.
You will have to tune the TV to UHF channel 14 and then try using
your
fine tuning control and tune DOWN. The ATV frequency is BELOW
UHF ch 14.

Using a newer TV or VCR that is cable-ready. Hook the TV or VCR up
to an
outside antenna and then set it for CABLE CHANNEL 60.

The first method is BY FAR the best. Down converters are around $80 and
you can
make your own beam (I did). Make sure your receiving antenna has the
same
polarity as the transmitter. Cross polorization loss on 70cm can be as
much
as 20db.

Radio Meteor Observation Bulletin No. 37 September 1996

1. FORWARD SCATTER METEOR OBSERVATIONS

Observer: E.P. Bus
Location: Groningen, Netherlands (6 degr 33' E, 53 degr 13' N)
Frequency: 72.11 MHz
Transmitter Location: Wroclaw, Poland, 130 kW, Distance 740 km
Antenna: Yagi, 3 elements, geographical azimuth 106 degr (ESE),
elevation 12 degrees
Receiver: Bearcat UBC 177XLT Scanning Radio, sensitivity: 0.5 uV
Observing method: Listening

Mean dead time corrected Sporadic Radio Meteor activity between
1996 July 13 and 1996 August 5.
Between brackets the statistical error of one sigma.

Mean Sporadic activity, starting at UT:

10h 11 12 13 14

85(5) 96(9) 90(10) 93(6) 84(8)

18h 19 20 21 22 23 0 1 2-2.5

91(9) 102(8) 112(6) 130(13) 131(11) 166(19) 178(18) 180(12) 103(11)

Mean Sporadic activity of long duration reflections > 1 sec, starting at UT:

10h 11 12 13 14 | 18 19 20 21 22 23 0 1 2-2.5
---
2 2 2 2 3 | 4 4 2 6 5 4 7 6 6

Dead time corrected counts of reflections during one hour intervals.
Between brackets the number of long duration reflections > 1 sec,
starting at UT:

August 11 August 12
18h 19 20 21 22 23 0 1 2-2.5

115(19) 127(12) 169(20) 216(24) 188(16) 271(36) 281(52) 320(70) 116(25)

August 12
10h 11 12 13 14

106(18) 180(21) 138(26) 130(16) 114(10)

. very high activity between Aug 11 23h UT and Aug 12 2h UT.

E.P. Bus

Observer: Maurice De Meyere
Location: Deurle, Belgium (3 37' E, 51 00' N)
Frequency: 66.51 MHz
Transmitter locations (all stations of more than 10 kW):
66.35 MHz, Klaipeda, Lithuania 12 kW, 05h00-22h00
66.41 Siedlce Poland 39 04h57(Sun05h57)-02h00(Sat03h00)
66.47 Viesintos Lithuania 12 05h00-22h00
66.50 Sofia Bulgaria 10 24hrs
66.56 Poznan Poland 56 04h57(Sun05h57)-02h00(Sat03h00)
66.62 Budapest Hungary 100 24hrs
66.68 Valmiera Latvia 20 06h00-22h00
Antenna: crossed Yagi, 4 elements, astronomical azimuth 270 o (= East),
elevation 27 o
Antenna amplifier: 25 dB max level 90 dBmuV
Receiver: commercial, Progresson 447A, TESLA (Bratislava)
The receiver was calibrated with a Marconi TF2008 signal
generator. Sensitivity: 5 muV (modulation frequency
1000 Hz, frequency sweep 38 kHz) at (S+N)/N = 20 dB

Observing method: automated setup, 150 samples/second, 8 bit resolution.
[Time and details of all individual meteor reflections are stored
on file in the University of Ghent format (Prometeos), and are
available for further analysis. Reduction software for DOS and
Windows available].

August 1996

Raw counts of reflections with a duration of at least 0.027 s
during one hour interval starting at UT:

```

Notes:

. local time = UT + 2 hours.
. % direct reception
. ? high count to be checked for potential sporadic E.

Maurice De Meyere

Observer: Werfried Kuneth
Location: Villach, Austria (13 53' E, 46 37' N)
Antenna: dipole with reflector
Receiver: AR-8000 at 59.2505 MHz, SSB mode,
Narrow passband filter, no preamplifier.
Transmitter: 150 kW TV video carrier in Bucaresti,
Romania, distance 950 km, east direction.
Observing method: the audio signal is fed into a real time FFT display (FFTDSP38 program from AF9Y) on the PC where 640 channels of 2 Hz width are recorded and stored continuously. The sensitivity of each 2 Hz wide channel is about -171 dBm. Every meteor reflection (in SSB mode) produces a distinct whistle, which is recorded easily by the real time FFT program and saved in .GIF pictures of 200 seconds each.
From the 1280 Hz wide received picture only one channel of 40 Hz width is used for meteor identification, the other nearby "channels" are used to monitor interference, which can be identified easily this way. If any interference occurs, the whole 200 second recording of one picture is not used for further processing.

The following figures show the total length of the meteor reflections during one hour,expressed as percentage. The number here shows 10 times this value. (e.g. 100 means 10 percent).

| Aug 1996

Notes:
. blank value means either no data available, interference,
sporadic "E", power failure, shutdown during thunderstorms or
transmitter shutdown.
. local time conversion: 2 hours ahead of UT (06h00 UT is 08h00 local).

. maximum Perseid activity during the early hours (UT) of Aug 12.

. *** Radio Meteor Gallery is open ***
I'd like to invite you all to my new Radio Meteor Gallery,
with the best spectrograph pictures out of about one million
recorded meteor reflections during last year. URL is
<http://www.net4you.co.at/user/kuneth/gallery.html>

Werfried Kuneth

Observer: Kimio Maegawa
Transmitter: 50 W CW 53.7500 MHz
Transmitter antenna: 2 element Cross Yagi 4dBi, zenith
Transmitting Location: Sabae city (136 11' E, 35 56' N)
Receiver: IC726 500 Hz BW , sensitivity -154 dBm min
Receiver antenna: 3el Yagi 7 dBi (70 deg, SE direction) height 10 m
Receiving Location: Ohno city (136 53' E, 36 00' N)
Data processing : Receiver output is fed into DX2-66 MHz PC and analyzed by
AF9Y's FFTDSP42 software.
Then stored every 4.22 min automaticaly with GIF format.
Play back GIF files and count echoes manually by the doppler
shift rejecting tropo signal or airplane echo.

Long duration echoes (t>2 sec):

| August 1996

20 | 28 23 55 65 35 18
---+---------+---------+---------+---------+---------+---------+-------
UT | 8/ 9 9/10 10/11 11/12 12/13 13/14
| August 1996
```

Notes:
. local time = JST = UTC + 9 hours
. the radiant was not located favorably when the Perseids maximum occurred: yet a significant relative increase (with respect to the adjacent days) is seen between 0h-2h UT on August 12.

Kimio Maegawa

Observer: Ton Schoenmaker
Location: Roden, Netherlands (6 degr 26' E, 53 degr 08' N)
Frequency: 66.89 MHz
Transmitter location:
Krakow, Poland, 120 kW, distance 980 km
Antenna: Horizontal Yagi, 5 elements, geographical azimuth 110 degrees (ESE), elevation 15 degrees
Receiver: Homemade convertor 65-67 MHz to 28-30 MHz + Barlow-Wadley 0-30 MHz receiver; total sensitivity 0.3 uV for 20 dB S/N with a bandwidth of 3 kHz
Observing method: Brown strip chart recorder, 9 or 18 inch/hour + occasional listening.

Dead time corrected counts of reflections during one hour intervals starting at:

```

-----+--------------------------------------
UT | 8 9 10 11 12 13 14
| August 1996
```

Remarks: * thunder-storm.
c continuous reception.
! Perseids outburst, maximum between 01 - 02 h UT.

Ton Schoenmaker

Observer: Chikara Shimoda
Location: Asahi, Nagano, Japan (137 51' E, 36 07'N)
Frequency: 81.4 MHz
Transmitter Locations: FM-Japan 81.3 MHz, 10 kW, distance 180 km
Antenna: 5 element Yagi directed to the Zenith.
Receiver: AM-FM Tuner (TRIO KT-1100)
Observing method: Meteor echoes output from center-tuning meter were recorded on a pen-recorder chart.
